Tra le *salite* del barometro più degne di nota vanno ricordate: dai mm. 749,3 delle 20h del 25 ai mm. 765,1 delle 10h del 29, mm. 16,8 in 86 ore, pari a mm. 0,20 all'ora; di questa variazione va considerato a parte il tratto della prima ora durante la quale il barometro è salito di mm. 3,4.

Tra le *discese* degne di nota vanno ricordate: quella dai mm. 763,7 delle 12h del 2 ai mm. 750,1 delle 22h del 4, mm. 13,6 in 58 ore, pari a mm. 0,23 all'ora e l'altra di mm. 763,9 delle 12h del 22 ai mm. 749,7 delle 20h del 25, mm. 14,6 in 80 ore, pari a mm. 0,18 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio di Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | III | IIIa | IV | V | VI | VIII | IX | X | XII | XIII | XIV | XVIa | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipit. generali | — | 1 | 1 | — | — | — | 1 | 1 | — | 1 | — | 1 | — | 1 | 7 |
| Con precipit. parziali | — | — | 1 | 2 | 1 | 1 | — | 2 | — | 3 | — | — | — | 1 | 11 |
| Senza precipitazioni . | 1 | — | — | — | 1 | — | 1 | 2 | 1 | 1 | 1 | — | 1 | 3 | 12 |
| Totali . . | 1 | 1 | 2 | 2 | 2 | 1 | 2 | 5 | 1 | 5 | 1 | 1 | 1 | 5 | 30 |

Da una parte il frequente formarsi delle forme bariche secondarie e l'andamento sinuoso delle isobare rendono difficile il dare le linee generali dello svolgersi del tempo; d'altra parte queste condizioni unitamente alla presenza di pressioni livellate forniscono una spiegazione della variabilità del tempo, per il qual motivo, come vedemmo al § 4, non vi fu quasi giorno, in cui in qualche parte della regione poco o tanto non abbia piovuto, come conseguenza di una formazione temporalesca sul luogo o nelle vicinanze.

Il periodo piovoso ininterotto più lungo del mese ha inizio al 21, all'insinuarsi di una striscia di bassa pressione dipendenza del ciclone sulla Scandinavia, tra i due nuclei anticiclonici che al 20 erano centrati uno sull'Atlantico, a W delle Isole Britanniche, e l'altro sulla Polonia; quest'ultimo nei giorni successivi s'allontanava verso levante. Il ciclone settentrionale era all'Isola Jean Mayen (22) sulla Scandinavia il 23 e 24 sulla Scandinavia meridionale; il 25 sul Golfo di Finlandia, il 26 s'allontanava sempre più verso E. Intanto il Mediterraneo era sede di forme secondarie. Va ricordato il ciclone secondario sull'alto Adriatico del 25 in cui sulle nostre regioni si ebbero piogge abbondantissime come pure abbondanti erano state quelle del 5, con configurazione presso che uguale, perchè in quel giorno si ebbe un secondario sulla Val Padana, dipendenza del ciclone settentrionale.

12. Sino al 15 del mese la differenza di livello tra la *marea* reale e quella prevista mediante l'analisi armonica sono piccolissime; appena di qualche cm., se si eccettuino il giorno 5, 6 e 7 (in sizigia) in cui tali differenze furono contenute tra i 15 e i 20 cm. (marea reale più alta della prevista).

La coincidenza non fu così buona nel periodo successivo che va suddiviso in due parti: dal 16 al 22, in cui la marea reale fu più bassa della prevista e la differenza massima nel livello fu raggiunta nella bassa marea del 18 con 25 cm.

Nei giorni successivi, dal 23 sino alla fine del mese, la marea reale è più alta della prevista; le differenze di livello maggiori sono 33 cm. nell'alta marea del 25 e 20 cm. in quella del 27. Inoltre va notato che al 26 nel pomeriggio la Laguna s'è mantenuta a livello leggermente crescente sino alla mezzanotte, anzichè dar luogo alla bassa marea delle 19,30, superando questa di 30 cm.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

**e per pianure,** limitate dai principali corsi d'acqua della regione e così denominate:

**pianura orientale** { *a*) fra Isonzo e Tagliamento; *b*) fra Tagliamento e Piave

**pianura occidentale** { *a*) fra Piave e Brenta; *b*) fra Brenta e Adige

**pianura polesana** { fra Adige e Po

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Su quattro cartine allegate al bollettino sono indicate le altezze del manto nevoso per alcune stazioni nei giorni indicati nelle cartine stesse.

In corrispondenza alle stazioni il cui nome per ragioni di spazio è abbreviato sono segnate in nero le quote s. l. m., ed in rosso le altezze della neve osservate in quel giorno.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di 1/10 di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di 1/20 di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

NB. — Dato il carattere prevalentemente carsico della regione compresa tra la Fiumara e l'Isonzo, la delimitazione dei bacini imbriferi è generalmente incerta e in qualche caso ha solo un carattere convenzionale.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d' acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all' idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all' altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l' elenco ed i risultati delle misure di portata eseguite nel mese a cura dell' Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell' acqua dei fiumi.** — Viene determinato e pubblicato: per l' **Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l' **Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(•), dato desunto dalle letture all' idrometro invece che dal registratore;
(••), dato interpolato;

°, idrometro o idrometrografo posto in località ov' è sentito l' influsso della marea o dell' apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d' acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell' Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

**SEGNI CONVENZIONALI**

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell' I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell' Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.³).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (--), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⚹ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - :≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⊔ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - -- Aghi di ghiaccio. - ∞ Caligine. - K Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⅂ Vento forte. - ⅂ Vento fortissimo. - ✢ Uragano di neve. - ⊖ Alone solare. - ( Alone lunare. - ⊕ Corona solare. - ( Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(•), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

# Note meteorologiche del mese di Luglio

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* confrontata con il valore medio dedotto da molti anni dà ovunque differenze inferiori al grado, tranne che a Bolzano e al Venda (+ 1,5), le differenze sono negative (temperatura in difetto) nella pianura veneta, esse sono positive (temperatura in eccesso) nelle altre zone. Nel forte abbassamento termometrico verificatosi nella prima decade va trovata la causa di questo leggero scostamento dalla media, malgrado i notevoli calori della terza decade. La media della prima e terza decade fu rispettivamente 18°,3 e 23°,1 al Venda, 21°,8 e 25°,3 a Venezia e 21°,9 e 25°,2 a Padova, ecc. ecc.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Luglio 1929 | 22,0 | 24,0 | 23,4 | 21,4 | 24,1 | 23,8 | 23,8 | 21,3 | 24,6 | 24,4 | 23,1 | 24,0 |
| Val. medio | 21,1 | 23,4 | 22,9 | 20,7 | 24,7 | 24,1 | 23,6 | 19,8 | 25,0 | 23,5 | 22,7 | 22,5 |

2. La temperatura nel suo andamento generale, dopo le giornate fredde della fine di giugno, era cresciuta segnando un massimo relativo ai primi del mese corrente, per poi discendere; tra l'8, il 9 e il 10 una serie di burrasche porta su tutta la regione un sensibile raffreddamento tanto che sono segnate le temperature minime del mese. Difatti all'8 al Venda 10°,5, al 9 a Venezia, 14°,0, a Padova 10°,8, ecc., al 10 a Bolzano, Pisino, Cortina, ecc. La temperatura, pure compiendo qualche fluttuazione, cresce rapidamente in seguito, tanto da raggiungere un massimo nella prima metà della terza decade, difatti il 23 il termometro segnò la massima nella maggior parte della località; a Padova essa fu di 36°,1, a Venezia di 35°,0, al Venda 31°,7.

L'escursione termometrica mensile pertanto fu al Venda, di 20°,2, a Venezia 21°,0, a Padova 25°,3, notevolmente superiore al valor medio dedotto da molti anni che pel Venda è 12°,2 e per Padova 21°,8.

3. In diciassette giorni (5-9-12-13-14 e dal 16 al 27) la temperatura minima del Venda fu superiore a quella di Padova a denotarci l'esistenza di un' *inversione* termica nelle ore notturne e nelle primissime ore del mattino. L'inversione si presentò con frequenza notevole nel periodo dal 14 al 27, durante il quale periodo manca solo al mattino del 15; questa mancanza è spiegata dal vento forte di quel giorno, dal cielo coperto e dalle precipitazioni, per quanto debolissime (mm. 0,2), verificatesi in prima mattina. In tre giorni le differenze Venda-Padova superarono i 4 gradi raggiungendo 4°,3 il 20, 4°,5 il 21 e il 24.

Anche le medie della minima diurna della seconda e terza decade del Venda sono risultate superiori di 2°,0 e 0°,8 alle rispettive medie di Padova.

Le varie medie decadiche dell'*altezza dell'isoterma zero* nell'aria libera sono di certo maggiori dei 3000 m., o dirò meglio, delle cime più alte della regione; pertanto l'estrapolazione dei dati al suolo assumendo come decremento lungo la verticale quello dell'aria libera — come si praticò nei mesi freddi — per un tratto così lungo è troppo incerta e la si omette.

Distribuendo gli Osservatori e le stazioni termometriche in vari gruppi, a seconda della loro quota, si hanno i seguenti valori medi della temperatura.

| Altezza m. sul livello del mare | 31 | 311 | 576 | 983 | 1250 | 1508 | 1812 | 2153 |
|---|---|---|---|---|---|---|---|---|
| Numero di stazioni . . . . | (15) | (10) | (8) | (11) | (14) | (12) | (5) | (2) |
| Temper. media prima decade . | 22,1 | 20,4 | 17,4 | 17,4 | 14,7 | 13,9 | 13,0 | 8,5 |
| Temper. media seconda decade . | 24,2 | 23,1 | 21,1 | 20,1 | 17,7 | 16,8 | 16,6 | 14,0 |
| Temper. media terza decade . . | 25,8 | 23,8 | 22,0 | 21,4 | 18,5 | 17,1 | 15,6 | 13,8 |
| Temperatura media mensile . . | 24,0 | 22,4 | 20,2 | 19,7 | 17,0 | 15,9 | 15,0 | 12,1 |

4. Dopo le *precipitazioni generali* del primo giorno del mese decorre un periodo asciutto di 4 giorni, al quale succede altro periodo di 4 giorni con precipitazioni. Dal 10 al 25 le precipitazioni compaiono qua e là in qualche singola località, e in generale in piccolissima quantità, tanto che si può dire un periodo asciutto; dal 26 al 29 si presentano 4 giorni con precipitazioni quasi generali; i due ultimi giorni del mese 30-31 sono quasi asciutti, avendo essi avuto poche precipitazioni in singole località.

Le quantità più notevoli di precipitazione furono all' 1 mm. 38,0 a Gorizia, mm. 35,5 a Treviso; al 2 (g. p.) mm. 55,6 a Slivia e mm. 52,0 a Montenero d'Idria; al 6 mm. 42,0 a S. Michele all'Adige con vera violenza di nubifragio; al 26 mm. 33,0 a Trento; al 7 (g. p.) mm. 70,6 a Timau, mm. 64,0 a Pontebba, mm. 41,0 a Resia (Alto bacino Adige).

All'infuori di un leggero incremento all'Adige il giorno 8, nel resto del mese le variazioni dei fiumi furono piccolissime e molto lente.

5. Nessuna delle stazioni (la più alta è Monteneve m. 2332) ha segnalato *neve*; quindi il manto nevoso è ridotto a quote superiori, alle località riparate o meglio ai nevai e ghiacciai.

6. La *media mensile della nebulosità* è quasi ovunque inferiore al valor medio dedotto da molti anni: a Trento la differenza è appena 0,1, tale differenza è leggermente superiore solo a Padova e Vicenza.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|
| Luglio 1929 | 4,5 | 3,1 | 3,3 | 3,9 | 4,2 | 3,1 | 4,0 | 3,6 | 4,1 | 3,3 |
| Val. medio | 3,8 | 4,0 | 3,8 | 6,1 | 4,3 | 4,7 | 3,7 | 3,4 | 5,2 | 4,1 |

7. La *quantità delle precipitazioni* anche in questo mese, come nei precedenti, è inferiore al valor medio dedotto da molti anni, senza eccezioni di nessuna località. S'accosta all'unità, meglio di tutti, il rapporto di S. Michele all'Adige, raggiungendo 0,92 per il forte nubifragio verificatosi il 6 (§ 4).

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Luglio 1929 | 43,4 | 45,8 | 4,0 | 36,6 | 79,8 | 57,8 | 65,2 | 24,5 | 74,9 |
| Valore medio | 77,5 | 92,4 | 56,0 | 83,3 | 129,0 | 207,0 | 118,7 | 98,5 | 95,5 |
| Rapporto | 0,56 | 0,50 | 0,07 | 0,44 | 0,62 | 0,28 | 0,55 | 0,25 | 0,78 |
| | **Venezia** | **Padova** | **Rovigo** | **Vicenza** | **Recoaro** | **Trento** | **S. Michele** | **Bolzano** | **Silandro** |
| Luglio 1929 | 13,2 | 10,2 | 9,4 | 22,1 | 73,6 | 77,0 | 91,0 | 40,6 | 57,4 |
| Valore medio | 48,8 | 61,5 | 46,8 | 76,9 | 144,0 | 90,4 | 99,3 | 110,9 | 62,0 |
| Rapporto | 0,27 | 0,17 | 0,20 | 0,29 | 0,51 | 0,85 | 0,92 | 0,37 | 0,93 |

8. Alla *carta delle isoiete* manca la caratteristica fondamentale, ossia la fascia di maggiori precipitazioni, lungo le Prealpi. Le maggiori precipitazioni (oltre 100 mm.) trovansi nella zona montuosa in una sottile striscia costeggiante il confine settentrionale ad E dell'Isarco (mm. 116 a S. Martino di Castrozza, mm. 157 a Rio Stavalins, mm. 170 a Chiapovano) come pure analoga striscia si stende sulle alpi Giulie, mm. 177 a Rifugio Gabriele d'Annunzio (Montenevoso), *totale mensile massimo*.

E' sotto ai 50 mm. la parte montuosa ad occidente di Merano (mm. 35 a Prato in Venosta), una lunga striscia ad W del corso del medio Adige e tutta la pianura (mm. 10 a Padova, mm. 13 a Venezia); qua e là anche in pianura si trova qualche area oltre a 50, p. e. una a Treviso (mm. 80) e a Castelfranco, altra nel Friuli (mm. 55 a Codroipo, mm. 113 a S. Giorgio di Nogaro). E' sotto ai 50 mm. anche la parte occidentale e meridionale della Penisola istriana (mm. 22 a Parenzo, mm. 49 a Pisino).

9. La *media diurna del vento* ha raggiunto ed oltrepassato i 20 km. ora al Venda in 7 giorni (4-7-8-12-15-26-28); la giornata più ventosa fu il 26 con una media diurna di 30,2 km./h. A Venezia in 3 giorni (7-8-28), a Trieste in due (l'8 e il 16) fu superato tale limite. Il giorno più ventoso in tutta la Venezia Euganea (coste e pianura) fu il 7; nel giorno successivo pure (8), spirò vento forte; al Venda la media fu km./h 25,2, a Venezia 25,3, a Trieste 28,8. Il percorso orario massimo si avea avuto al Venda con 57 km. da W al 7, e a Venezia con 52 km. nello stesso giorno e a Trieste con 52 il giorno successivo.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume le direzioni si distribuiscono di preferenza nella parte della rosa che da SW per W va a ENE, (88 % a 10 direzioni) con massimi a ENE (9 %), a N (12 %), a WNW (15 %).

A Trieste la rosa è maggiormente sviluppata in due settori: uno da ENE a SE (42 % a 4 direzioni) e massimo a SE (19 %) e l'altro da W a NNW (35 % a 4 direzioni) e massimo a WNW (15 %).

A Venezia scarse sono le direzioni occidentali e precisamente da N a S (27 % a 10 direzioni), mentre tra le rimanenti si hanno due massimi spiccati uno a NNE (15 %), l'altro a SSE (24 %).

Al Venda sono scarse le direzioni da WSW per N a NNE (17 % a 7 direzioni); tra le altre ci sono tre massimi uno ad E (13 %), uno a SSE (13 %) e un terzo a SW (11 %).

A Padova sono scarse le direzioni a SE per S a NW (18 % a 7 direzioni); tra le altre ci sono due massimi uno a NE (11 %), l'altro ad E (14 %).

A Trento la rosa presenta la sua forma trilobata; un lobo con un massimo a NW e NNW (11 % per ciascuna), un altro con massimo ad ENE (25 %) e un terzo con un massimo a SSE (11 %).

10. La *media della pressione atmosferica* di questo luglio è alquanto superiore al suo valor normale; difatti l'altezza barometrica di questo mese a Venezia è mm. 762,5, mentre il suo valor normale è mm. 760,8, quindi una differenza di mm. 1,7.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 770,4 alle 10h dell'11 e l'altezza minima è stata di mm. 750,7 alle 24h del 6; l'ampiezza dell'escursione pertanto fu di mm. 19,7, superiore all'ampiezza media della regione, che s'aggira attorno ai 13 mm.

Nel periodo dal 13 al 23 il barometro si mantenne sensibilmente costante, segnando la sola oscillazione diurna; nell'altra parte del mese si ebbero variazioni di qualche importanza.

Tra le salite del barometro degne di nota va ricordata quella dai mm. 751,8 delle 4h del 7 ai mm. 759,7 delle 12h dello stesso giorno, mm. 7,9 in otto ore, pari a mm. 0,99 all'ora; la variazione era stata molto più forte nelle 2 prime ore durante la quale essa fu di mm. 2 all'ora.

Tra le discese degne di nota va ricordata quella dai mm. 761,3 delle 6h del 6 ai mm. 750,7 delle 24h dello stesso giorno, mm. 10,6 in 18 ore pari a mm. 0,59 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le condizioni di tempo nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | III | IIIa | VI | VII | VIII | IX | X | XII | XIII | XV | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipitazioni generali . | 1 | — | — | 1 | — | — | — | — | 2 | — | — | — | 4 |
| Con precipitazioni parziali. . | — | — | 1 | — | 1 | — | — | — | — | — | 1 | 1 | 4 |
| Senza precipitazioni . . . | 1 | 1 | 1 | 1 | — | 1 | 5 | 2 | 6 | 1 | 2 | 2 | 23 |
| Totali . . . | 2 | 1 | 2 | 2 | 1 | 1 | 5 | 2 | 8 | 1 | 3 | 3 | 31 |

Appare subito dal precedente specchietto che le precipitazioni mancarono col tipo III, IIIa e XV, e che vi furono invece coi tipi XVIII e con XIII (anche a pressione elevata), ossia in altri termini che non è netta, come al solito, la distinzione tra tipi da precipitazioni e tipi senza. Devesi ricercare la ragione di ciò non solo nella difficoltà di classificazione, perchè le differenze di pressione tra luogo e luogo non sono così marcate come nelle altre stagioni (in tre giorni non si potè classificare la configurazione), ma anche nel fatto che le precipitazioni sono quasi tutte di natura temporalesca e i temporali hanno avuto frequentemente origini locali e sviluppi limitati.

Il gradiente barometrico fu forte specie nei seguenti giorni:

Al 7, gradiente da W, che portò vento prevalentemente meridionale nella nostra regione, con qualche raffica più forte da W.

All'8, l'avanzata del promontorio a N delle alpi ha portato vento dal primo quadrante, forte anche a Trieste.

Al 28 pure il promontorio a N delle Alpi porta vento dal primo quadrante sul Carso e sulla Venezia Euganea.

Mentre tutte le coste occidentali dell'Europa sono sotto l'influenza di vaste aree cicloniche atlantiche, al 2 l'Europa passa sotto il dominio di alte pressioni, le quali tengono lontane le precipitazioni da noi; queste invece hanno inizio al 6, quando sulle Baleari si costituisce un secondario, e continuano nei giorni successivi, però sempre e dovunque scarse (§ 4) sino al 9. L'anticiclone che nei giorni precedenti si era affacciato alla penisola iberica, al 10 è passato sull'Europa centrale, dove dominano alte pressioni che determinano un gradiente generale settentrionale sulle nostre regioni, mentre nel bacino mediterraneo dal 17 al 24 la pressione è livellata o quasi. In queste condizioni, con debole ventilazione e cielo sereno, il termometro andò salendo raggiungendo valori forti segnalati al § 2.

Il ciclone settentrionale, nella sua marcia verso i quadranti orientali, al 24 viene ad interessare anche il Mediterraneo occidentale, cosicchè, unitamente al promontorio da ponente a N delle Alpi, ne risulta per il 26 e per il 27 una saccatura che apporta perturbamenti temporaleschi con precipitazioni quasi generali, e ciò sino al 29, quando, allontanatesi le depressioni verso levante, la nostra regione passa sotto il controllo dell'anticiclone avanzato attraverso il Golfo di Guascogna.

12. La *marea* reale si mantiene sopra alla marea prevista con l'analisi armonica sino al 6; dopo un giorno o due in cui, per piccoli spostamenti di orario, alternativamente fu sopra e sotto, dal 9 in poi, per tutto il mese, la marea reale si mantiene sempre sotto alla marea prevista.

Nella seconda bassa marea del giorno 11 si ebbero i massimi scostamenti in tempo e in livello; difatti la bassa marea si verificò con 65 minuti di ritardo sulla prevista, e a 36 cm., anzichè ad 8, sotto il livello medio; quindi 28 cm. di differenza; al 12 l'ora fu pressochè coincidente, ma il dislivello tra marea prevista e marea reale fu di 30 cm.

Dal 28 al 31 è aumentata l'ampiezza dell'escursione diurna della marea (abbassamento della bassa, sollevamento della più alta) rispetto a quella prevista.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure,** limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.$^2$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.$^2$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato; per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(*), dato desunto dalle letture all'idrometro invece che dal registratore;
(**), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

(**) Durante i mesi estivi oltre alle suaccennate derivazioni ve ne sono numerose altre, fra Pescantina e Legnago, le cui portate molto variabili non si possono accertare praticamente. Le portate e i deflussi calcolati per Legnago non sono quindi quelli corrispondenti all'effettivo bacino tributario. Non sono stati calcolati conseguentemente i contributi unitari.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

N.B. — I pozzi per le osservazioni freatimetriche della pianura fra Canal Bianco - Tartaro - Po hanno cessato di funzionare col mese di luglio 1929.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell' I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell' Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

TABELLE I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

TABELLA III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

TABELLA IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

TABELLA V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

TABELLA VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell' alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (--), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all' imboccatura del Canale Vittorio Emanuele III, a fianco dell' Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2.0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris [1] alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⚹ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - !≡ Nebbia pioviggginosa. - ═ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ⟵ Aghi di ghiaccio. - ∞ Caligine. - ⊼ Temporale. - ⊤ Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⅂ Vento forte. - ⅂ Vento fortissimo. - ✢ Uragano di neve. - ⊖ Alone solare. - ⋲ Alone lunare. - ⊕ Corona solare. - ⋹ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(•), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera,* vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere **grassetto**.

# Note meteorologiche del mese di Agosto

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è in generale superiore al valor medio dedotto da molti anni: la differenza è forte specie nella Venezia Giulia, minima nella vallata dell'Adige; a Trento anzi la media è inferiore a tale valor medio.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Agosto 1929 | 21,8 | 24,6 | 23,7 | 20,7 | 24,0 | 23,7 | 23,3 | 20,9 | 23,9 | 23,8 | 20,9 | 21,8 |
| Val. medio | 20,0 | 22,7 | 22,2 | 19,9 | 24,1 | 23,2 | 22,6 | 19,6 | 23,8 | 22,6 | 21,6 | 21,5 |

2. La temperatura, nel suo andamento generale, ai primi del mese si presenta in diminuzione; è raggiunto un primo minimo nei giorni dal 3 al 5, a cui succede un rapido aumento, tra l'11 e il 15 è segnato il massimo: all'11 a Venezia 32°,0, al 17 a Padova 34°,5 e al Venda 29°,5, al 18 a Gorizia, Pisino, ecc.

In seguito la temperatura torna a discendere: tra il 22 e il 24 è segnato il minimo principale del mese in tutta la regione, al 22 al Venda 11°,7, a Venezia 16°,0; al 24 a Padova 13°,6.

L'escursione termometrica mensile fu al Venda di 17°,8, a Venezia 16°,0, a Padova 20°,9.

3. In quindici giorni la temperatura minima del Venda fu superiore a quella di Padova, la massima sempre inferiore, e ciò sta a denotarci l'esistenza nelle ore notturne e nelle primissime ore del mattino di un'*inversione termica*, ossia temperatura più bassa in piano, più alta in alto.

Queste inversioni si sono presentate in 4 gruppi: il primo gruppo comincia al 4 (niente al 5, perchè piove a Padova), al 6-7-8-9, giorni, specie i primi due, sereni. La differenza tra Padova e Venda al 7 ha raggiunto i 4°,3, *la differenza maggiore del mese*, all'8 fu 4°,1. Le inversioni riprendono al 15 col rasserenarsi e continuano sino al 18; in questi giorni la differenza Padova-Venda fu compresa tra 2°,3 il 15 e 2°,9 il 17; e infine un altro periodo d'inversioni dal 24 alla fine del mese (escluso il 28); la differenza in questi giorni tra Venda-Padova è compresa tra 2°,2 il 29 e 4°,1 il 31.

Pure dalla sola ispezione della temperatura in pianura è lecito arguire che, anche in questo mese, le varie medie decadiche dell'altezza dell'isoterma zero nell'aria libera sono maggiori dei 3000 m., o dirò meglio, delle cime più alte della regione; pertanto l'estrapolazione dei dati al suolo, assumendo come decremento lungo la verticale quello dell'aria libera come si pratica nei mesi freddi, per un tratto così lungo, è troppo incerta e la si omette.

Distribuendo gli osservatori e le stazioni termometriche in vari gruppi a seconda della loro quota, si hanno i seguenti valori medi della temperatura.

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Altezza m. sul livello del mare | 31 | 311 | 576 | 933 | 1251 | 1528 | 1807 | 2152 |
| Numero di stazioni . . . . | (15) | (10) | (8) | (11) | (13) | (10) | (5) | (3) |
| Temper. media prima decade . | 23,5 | 20,7 | 19,9 | 18,5 | 15,3 | 14,4 | 12,1 | 11,0 |
| Temper. media seconda decade . | 25,3 | 22,5 | 20,8 | 19,9 | 16,6 | 15,8 | 13,7 | 13,4 |
| Temper. media terza decade . . | 23,5 | 20,8 | 19,2 | 18,4 | 15,3 | 14,7 | 12,8 | 12,3 |
| Temperatura media mensile . . | 24,1 | 21,3 | 20,0 | 18,9 | 15,7 | 15,0 | 12,6 | 12,2 |

4. Come il 30 e 31 del precedente, anche il 1° di questo mese quà e là si ebbe qualche precipitazione, ma in generale così scarsa che anche tal giorno si può classificare con gli asciutti. Le precipitazioni furono diffuse, quasi generali il 2 e 3; il totale della pioggia nei due giorni fu a Tarvisio mm. 73,8, a Belluno mm. 98,0, a Venzone mm. 179,8, di cui mm. 105,8 nel solo giorno pluviometrico 3. Si possono ricordare per il 2 (g. p.) mm. 53,4 a Resia (Adige), mm. 42,0 a Riva di Tures, ecc.; al 3 (g. p.) mm. 57,6 a Plezzo, mm. 62,8 a Claut ecc.

Al 4 le precipitazioni mancano quasi del tutto; riprendono generali il 5, abbondanti specie nell'Istria, al 6 (g. p.) mm. 45,6 a Dignano.

Dopo 4 giorni asciutti le precipitazioni riprendono dal 10 al 13, generali solo l'11.

Le variazioni più notevoli dei fiumi furono al 3 in cui si ebbe un colmo a m. 2,13 raggiunto rapidamente a Latisana dal Tagliamento, un altro all'Adige a Trento m. 2,04; hanno prodotto un leggero aumento nell'Adige le piogge del 20 al 23.

6. La *media mensile della nebulosità* in generale ha piccole differenze dal valor medio dedotto da molti anni, ora più, ora meno; la differenza però è forte a Pisino (più coperto) e a Belluno (meno coperto della media).

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Agosto 1929 | 4,5 | 3,1 | 3,1 | 3,6 | 3,9 | 3,4 | 3,9 | 3,7 | 3,7 | 4,6 | 4,1 |
| Val. medio | 2,7 | 3,5 | 3,7 | 5,5 | 3,6 | 4,1 | 3,2 | 3,2 | 3,9 | 4,4 | 3,9 |

7. La quantità delle precipitazioni in questo mese è inferiore al valor normale in pianura e nel Golfo del Carnaro (Padova rapporto 0,65, Rovigo 0,37); invece è superiore al valor normale nella zona montuosa, specie nell'alto Adige (Bolzano rapporto 1,47, Silandro 1,62).

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Agosto 1929 | 62,7 | 88,8 | 31,4 | 94,6 | 88,8 | 121,6 | 178,7 | 65,6 | 50,9 |
| Valore medio | 108,1 | 75,0 | 57,0 | 96,0 | 134,0 | 189,6 | 106,4 | 101,1 | 84,2 |
| Rapporto | 0,58 | 1,18 | 0,55 | 0,99 | 0,66 | 0,64 | 1,68 | 0,65 | 0,60 |
| | **Venezia** | **Padova** | **Rovigo** | **Vicenza** | **Recoaro** | **Trento** | **S. Michele** | **Bolzano** | **Silandro** |
| Agosto 1929 | 49,0 | 39,8 | 19,6 | 61,4 | 70,6 | 100,0 | 151,0 | 138,6 | 103,6 |
| Valore medio | 51,7 | 60,9 | 53,3 | 91,3 | 114,0 | 84,0 | 84,0 | 94,0 | 64,0 |
| Rapporto | 0,95 | 0,65 | 0,37 | 0,67 | 0,61 | 1,19 | 1,80 | 1,47 | 1,62 |

8. Com'è quasi di regola nei mesi estivi, nella *carta delle precipitazioni* manca la solita fascia dei massimi lungo le Prealpi.

In pianura ha avuto meno di 30 mm. la zona tra Adige e Po; a levante dei Berici e degli Euganei si hanno precipitazioni superiori ai 50 mm. tranne che in una stretta striscia che dalla gola tra Berici ed Euganei si prolunga verso NE sino a comprendere la confluenza Meduna-Livenza; per il rimanente si può dire a grandi linee che, partendo dalle coste e procedendo verso NW, le precipitazioni crescono sensibilmente man mano che si avanza anche nell'interno della zona montuosa. Alle sorgenti dell'Adige e dei suoi affluenti, in particolare dell'Isarco, sono superati i 200 mm. (Resia mm. 311, Fleres mm. 220 ecc.).

L'area delle precipitazioni massime del mese è racchiusa dall'isoieta 300 mm., è stretta e relativamente lunga e trovasi a Sud di Tolmezzo e si stende dal medio Meduna fino a Moggio Udinese (Clauzetto mm. 348, Alesso mm. 375, *totale massimo del mese*). Sulle Alpi Giulie si hanno valori tra i 70 e 100 mm.; i 100 mm. furono superati in una stretta fascia lungo il confine (Rifugio Gabriele d'Annunzio mm. 150). La punta meridionale dell'Istria ha avuto meno di 50 mm. (Rovigno mm. 40). Sono appena superati i 100 mm. in una sottile zona che avvolge Trieste (mm. 100 Servola) e in un'altra zona che comprende i monti Caldiera (mm. 134 a Laurana).

9. La *media diurna della velocità del vento* ha raggiunto ed oltrepassato i 20 km. ora al Venda in 9 giorni (3-9-10-11-12-13-21-22-30); a Venezia in 4 giorni: (3-11-21 22); a Trieste in 10 giorni (3-11-12-14-21-22-25-27-29-30). Violento fu il vento specialmente il 3 con direzione prevalente da ENE al Venda, Venezia e Trieste; invece con direzione più da Nord nel retroterra. Le medie di quel giorno furono le maggiori del mese: al Venda km. 36,2, a Venezia 31,3, a Trieste 48,0, a Padova 13,6.

I percorsi orari maggiori furono a Venezia 54 km. NNE il 19, a Venezia 46 km. da ENE il 3 e il 22, a Trieste 58 km. il 22 (*massimo del mese della regione*), a Padova 23 km. il 3.

Le direzioni prevalenti in tutti questi giorni ventosi sono comprese nel 1° quadrante.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume scarse sono le direzioni comprese tra SSW e ESE (8 %, a 5 direzioni); tra le rimanenti ci son tre massimi: uno a ENE (14 %), l'altro a NNE (14 %), un terzo a WNW (10 %).

A Trieste spetta il massimo di frequenza alla direzione ENE (32 %), un altro ad WSW (10 %); sono pochissimo frequenti le direzioni comprese nel settore da W a SSE (14 %, a 6 direzioni) e quelle comprese nel settore da NE a NNW (9 %, a 4 direzioni).

Al Venda le più frequenti sono le direzioni comprese nel settore da E a NE (43 %, a 3 direzioni) con poca differenza tra l'una e l'altra; tra le rimanenti spetta un massimo a SW (9 %).

A Venezia sono scarse tutte le direzioni occidentali comprese nel settore da N a S (24 %, a 9 direzioni); tra le rimanenti vi sono tre massimi: uno a NNE (26 %), uno a ENE (14 %) e infine uno a SSE (16 %).

A Padova le direzioni più frequenti sono quelle comprese nel settore da ENE per N a WNW (76 %, a 9 direzioni) con un massimo a N (15 %).

A Trento la rosa dei venti ha la solita forma trilobata ma è pochissimo sviluppato il lobo meridionale; difatti alle direzioni che vanno da E ad W spetta il 13 %, a 9 direzioni, al settore del 1° quadrante ENE e NE spetta il 31 %, a 2 direzioni e infine al settore del 4° quadrante NW e NNW spetta il 37 %, a 2 direzioni pure.

10. La *media della pressione atmosferica* di questo agosto è leggermente inferiore al valor normale; difatti l'altezza barometrica di questo mese a Venezia è mm. 760,8, mentre il suo valor normale è mm. 761,2, quindi una differenza di mm. 0,4.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 764,7 alle 10h del 14; il valor minimo è stato di mm. 754,5 alle 4h del 2; l'ampiezza dell'escursione pertanto è stata di mm. 10,2, inferiore all'ampiezza media della regione che s'aggira attorno ai 15 mm.

Deboli furono le variazioni del barometro nella seconda metà del mese; il barogramma è pressochè orizzontale, vi appare la sola oscillazione diurna. L'unica variazione di qualche importanza è una salita dai mm. 755,0 delle 18h del 2 ai mm. 762,2 delle 24h del 3, mm. 7,2 in 30 ore, pari a mm. 0,24 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni da cui essi furono accompagnati nel corso della giornata (da una mezzanotte alla successiva).

| Tipi | I | III | IV | VII | X | XI | XIII | XV | XVIIb | XVIIc | XVIII | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipitazioni generali . . . | — | 1 | 1 | 4 | — | — | — | — | 1 | 1 | — | 8 |
| Con precipitazioni parziali . . . | — | — | — | — | — | 1 | 1 | — | 1 | 1 | — | 4 |
| Senza precipitazioni . . . . . . | 2 | 1 | — | — | 1 | 1 | 2 | 1 | 1 | — | 10 | 19 |
| Totali . . . . . | 2 | 2 | 1 | 4 | 1 | 2 | 3 | 1 | 3 | 2 | 10 | 31 |

La configurazione generale del primo del mese è caratterizzata dalla presenza di un ciclone centrato nel mar del Nord e da un anticiclone a W della penisola Iberica che avanzano rapidamente verso levante. Al 2 si stabilisce una depressione sull'Italia settentrionale; ad essa son dovute le perturbazioni temporalesche del 2 e 3, sospese il 4 per l'avanzata verso il Mediterraneo dell'anticiclone; le perturbazioni poi riappaiono al 5, quando, per un avvicinamento del ciclone settentrionale, si costituisce tipo III. Ma in seguito ritornando l'Europa Centrale sotto l'alta pressione, ritorna il tempo asciutto.

Alla caratteristica saccatura da E tipo VII (tipo atlantico) è dovuto il periodo temporalesco con precipitazioni generali nella nostra regione dal 19 al 22: questo cessa non appena, avanzando dall'Atlantico l'anticlone sino a mandare un promontorio a N delle Alpi, si costituisce sull'Italia un gradiente generale da NW (tipo XVIII) favorito anche dalla permanenza quasi costante in tutto il mese di una depressione nel Mar di Levante. E' questa una propaggine del ciclone che nella stagione estiva ha residenza quasi abituale nel Mar Rosso. Questa situazione rimane pressochè inalterata dal 23 in poi; solo al 25 essa viene brevemente modificata dalla comparsa di un ciclone nel Mar di Tripoli (tipo XI), che tosto scompare, esso pure assorbito verso levante; il tempo pertanto si mantiene permanentemente a sereno.

12. Le differenze tra la *marea* reale e quella prevista con l'analisi armonica sono in generale piccole in tutto il mese; di segno vario e piccolissime, pressochè trascurabili, nei giorni dal 5 al 9 e dal 25 al 27.

La marea reale fu leggermente più alta della prevista dall'1 al 4, dal 21 al 23; essa fu più bassa nei giorni dal 10 al 18, al 24 e dal 29 al 31. Attorno alle quadrature si ebbero escursioni maggiori delle previste, ossia bassa marea più bassa della prevista, alta marea più alta della prevista.

La differenza più forte è quella di circa 20 cm. (marea più bassa e in anticipo di circa un'ora di quella prevista) tra le 7h e le 8h dell'11. In quel mattino la laguna fu agitata, mentre imperversava un temporale. Il barometro segnò una oscillazione di circa 5 ore e alle 4 ha un dente di mm. 1,7; in quell'ora il vento, che prima spirava da WNW, passa bruscamente a NNW, per poi passare lentamente a NNE e mantenervisi tutto il giorno. L'anemografo Dines verso le 4 1/2 segna una raffica di 60 km./h, preceduta e seguita da una calma di qualche minuto: la velocità media dell'ora tra le 4 e le 5 è 22 km., leggermente inferiore a quella dell'ora precedente (30 km.) e quella dell'ora successiva (34 km.); poi il vento continua forte.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^{1}/_{10}$ di m.$^{2}$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^{1}/_{20}$ di m.$^{2}$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(*), dato desunto dalle letture all'idrometro invece che dal registratore;
(**), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

(**) Durante i mesi estivi oltre alle suaccennate derivazioni ve ne sono numerose altre, fra Pescantina e Legnago, le cui portate molto variabili non si possono accertare praticamente. Le portate e i deflussi calcolati per Legnago non sono quindi quelli corrispondenti all'effettivo bacino tributario. Non sono stati calcolati conseguentemente i contributi unitari.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

(1) L'intumescenza del giorno 20 ha determinato un notevole escavo del fondo che è andato successivamente colmandosi col diminuire del livello liquido. — (2) La portata è stata calcolata in base alle velocità superficiali. — (3) La notevole differenza tra l'altezza idrometrica della misura e quella adoperata per il calcolo delle portate giornaliere, è dovuta alle forti variazioni verificatesi nei livelli idrometrici. — (4) A questa portata vanno aggiunti mediamente mc. 0,7 al sec., che competono alla derivazione in riva sinistra e che sono scaricati nel lago di Caldonazzo, bacino del Brenta. — (5) Non sono compresi Kmq. 4 del bacino del Lago delle Piazze le cui acque sono artificialmente scaricate nell'Avisio.

# Materiale in sospensione nell'acqua dei fiumi

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;

», non giunte le osservazioni, dato mancante;

?, dato incerto.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

». dato mancante; — (••), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all'imboccatura del Canale Vittorio Emanuele III, a fianco dell'Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2,0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## Ore ed altezze delle alte e basse maree — Tabella I.

# METEOROLOGIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⚹ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - :≡ Nebbia piovigginosa. - ═ Nebbia all'orizzonte. - ⋁ Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ← Aghi di ghiaccio. - ∞ Caligine. - ⫪ Temporale. - ⊤ Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⸓ Vento forte. - ⸓ Vento fortissimo. - + Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

··, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

# Note meteorologiche del mese di Settembre

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura* è ovunque superiore al valor medio dedotto da molti anni; tale differenza supera i due gradi a Trieste (2°,7), a Pisino, a Gorizia, al Venda; è tra uno e due a Belluno, a Padova, a Rovigo, a Trento e a Bolzano; è al di sotto di un grado a Treviso (0°,7).

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Sett. 1929 | 18,3 | 21,8 | 20,5 | 17,7 | 20,7 | 21,2 | 20,0 | 18,7 | 21,0 | 20,8 | 19,0 | 19,7 |
| Val. medio | 15,9 | 19,1 | 18,2 | 16,6 | 20,0 | 19,5 | 18,9 | 16,4 | 20,0 | 19,0 | 17,9 | 18,0 |

2. L'*andamento generale della temperatura* nel corso del mese è decrescente; le maggiori temperature sono segnate al principio raggiungendo valori che in certi anni non furono toccati neanche d'estate: esse si verificarono all'1 e al 2 nell'interno della zona montuosa; al 3 a Padova con 33°,7, a Venezia con 34°,0, al 7 al Venda con 29°,3. Successivamente, dopo essere passato per due minimi secondari verso l'8 e verso il 18, il diagramma termometrico raggiunge il minimo principale: al 25 a Belluno, Gorizia ecc., al 26 al Venda con 10°,0 e nelle località elevate in genere, al 30 a Padova con 5°,9, a Venezia con 9°,1, ecc.

L'escursione termometrica mensile fu al Venda 19°,3, a Venezia 24°,9, a Padova 27°,8, valori molto elevati.

3. In 23 giorni la temperatura minima al Venda fu superiore a quella di Padova, la massima sempre inferiore; ciò sta a denotarci l'esistenza nelle ore notturne e nelle prime ore del mattino di un'inversione termica, ossia temperatura più bassa in piano, più alta sui colli.

Queste inversioni si sono presentate in due gruppi; il primo gruppo è la continuazione di quello iniziato al 24 del mese precedente; esso, esclusi il 28 di quel mese e l'8 e l'11 di questo, va sino al 13. La sospensione dell'8 è dovuta al vento forte orientale che mescolava lo strato atmosferico; quella dell'11 all'essere la pianura coperta da nubi basse (strati) che avvolgevano le cime dei Colli come una nebbia. In questo periodo si sono avute le differenze Venda-Padova più forti; difatti al primo tale differenza raggiunse 6°,2, al 5 fu 5°,4; la media decadica della minima diurna al Venda fu 19°,5, più alta di quella a Padova che fu 16°,0.

Nei giorni dal 14 al 18 privi d'inversioni il cielo fu prevalentemente coperto, spesso con leggere precipitazioni.

L'altro periodo d'inversioni va dal 19, senza nessuna interruzione, sino alla fine del mese. I valori più notevoli raggiunti dalle differenze Venda-Padova furono 6°,2 il 30, 4°,6 il 27, 3°,5 il 26, ecc.

Pure dalla sola ispezione della temperatura in pianura è lecito arguire che, anche in questo mese, le varie medie decadiche dell'*altezza dell'isoterma 0* nell'aria libera sono maggiori dei 3000 metri, o dirò meglio, delle cime più alte della regione; pertanto l'estrapolazione dei dati al suolo, assumendo come decremento lungo la verticale quello dell'aria libera, come si pratica nei mesi freddi, per un tratto così lungo è troppo incerta e la si omette.

Distribuendo gli osservatori meteorologici e le stazioni termometriche in vari gruppi, a seconda delle loro quote, si hanno i seguenti valori medi.

| Altezza m. sul livello del mare | 31 | 310 | 576 | 946 | 1250 | 1516 | 1830 | 2152 |
|---|---|---|---|---|---|---|---|---|
| Numero di stazioni . . . . | (15) | (9) | (8) | (12) | (14) | (11) | (5) | (3) |
| Temper. media prima decade . | 24,7 | 21,0 | 20,1 | 19,0 | 17,1 | 16,0 | 14,7 | 14,5 |
| Temper. media seconda decade . | 21,8 | 19,4 | 18,1 | 16,9 | 15,0 | 14,1 | 13,1 | 12,0 |
| Temper. media terza decade . . | 17,2 | 14,7 | 12,9 | 12,0 | 10,3 | 9,2 | 8,9 | 6,3 |
| Temperatura media mensile . . | 21,2 | 18,4 | 17,0 | 16,0 | 14,1 | 13,1 | 12,2 | 10,9 |

4. Le pochissime *piogge* furono variamente distribuite nel mese. Al primo si ha un giorno a poche precipitazioni parziali; solo al 16 le precipitazioni furono così diffuse da potersi ritenere come generali; esse furono precedute da due giorni e seguite da uno a precipitazioni parziali; sono pure a precipitazioni parziali il 20 e il 24.

Con sì scarse precipitazioni, com'è da prevedersi, il livello dei fiumi fu in continua diminuzione.

5. Nessuna registrazione di *neve*, nè di manto nevoso, neanche dalle stazioni più elevate.

6. La *media mensile della nebulosità* supera i $^3/_{10}$ solo a Pisino (3,7), a Treviso (3,6), a Padova (3,5) e a Trento (3,1); essa ovunque è inferiore al valor medio dedotto da molti anni.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Trento | Bolzano | Rovigo |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Sett. 1929 | 3,7 | 2,3 | 2,6 | 2,7 | 3,6 | 2,3 | 3,5 | 2,7 | 3,1 | 2,7 | 2,1 |
| Val. medio | 4,0 | 4,3 | 4,4 | 5,8 | 4,2 | 5,0 | 4,1 | 3,8 | 4,7 | 4,3 | 4,4 |

7. La *quantità delle precipitazioni* in questo mese è ovunque notevolmente inferiore al valor normale; il rapporto in qualche località non raggiunse neanche $^1/_{10}$; dove la pioggia fu meno scarsa tale rapporto raggiunse i $^4/_{10}$ come a Bolzano, a Gorizia, ecc.

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Sett. 1929 | 46,6 | 8,0 | 8,0 | 20,9 | 50,4 | 70,4 | 40,4 | 5,0 | 22,0 |
| Valore medio | 166,4 | 110,0 | 90,0 | 101,0 | 140,0 | 240,5 | 121,5 | 112,2 | 114,2 |
| Rapporto | 0,28 | 0,07 | 0,09 | 0,21 | 0,36 | 0,29 | 0,33 | 0,04 | 0,19 |

| | Venezia | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|---|
| Sett. 1929 | 5,0 | 19,4 | 11,6 | 7,4 | 10,4 | 22,0 | 34,0 | 26,2 | 7,4 |
| Valore medio | 64,6 | 72,3 | 59,4 | 124,8 | 186,0 | 75,0 | 103,0 | 72,0 | 41,0 |
| Rapporto | 0,08 | 0,27 | 0,19 | 0,06 | 0,05 | 0,29 | 0,33 | 0,36 | 0,18 |

8. In tutta la pianura le precipitazioni cadute nel mese furono inferiori ai 10 mm. Nella regione montuosa trovansi alcune zone con una quantità superiore ai 50 mm., una ristretta sui Lessini mm. 101 Tregnago, mm. 67 Roverè, un'altra più ampia comprende Cavalese mm. 65, Nova Levante mm. 146, Passo Pordoi mm. 69, S. Cassiano mm. 88, Cortina mm. 70, M. Croce mm. 62.

Un'altra area oltre i 50 mm. si stende sulle Alpi Giulie. L'isoieta 50 lascia ad W Tarvisio (mm. 24) e per il passo di Resia scende a Gemona (mm. 46) e poi, tenendosi sulla destra del Torre (Udine mm. 63) s'interna nuovamente nella zona montuosa, (Gorizia mm. 50), per poi scendere lungo il Carso, toccare il confine nella regione Liburnica lasciando fuori Fiume (mm. 46).

E' oltre i 100 mm. una zona che comprende Vipacco (mm. 127), Pocrai del Piro (mm. 185, *totale massimo del mese*), Montenero d'Idria (mm. 131).

Val Venosta e le valli ad essa confluenti hanno meno di mm. 25.

9. La *media diurna della velocità del vento* ha raggiunto ed oltrepassato i 20 km. ora al Venda in 7 giorni, 8, 13, 17, 18, 21, 25, 28; a Venezia in due giorni 17 e 21, a Trieste in 9 giorni 8, 17, 18, 21, 23, 24, 25, 26, 28.

Il 17 è stato il giorno più ventoso in tutta la regione: la velocità media al Venda fu 28,6 km. ora, a Trieste 38,0, a Venezia 25,8, a Padova 8,4.

Sin dal giorno precedente (16) una depressione sulle coste meridionali Francesi a mm. 762 e un anticiclone sulla Russia orientale davano luogo a un notevole pendio da NE sull'Ungheria, Austria e Venezia Giulia. La corrente del 1° quadrante così determinata al 17 invade le nostre regioni, raggiungendo i valori elevati sopra esposti. Al 18 v'è un leggero attenuamento a Venezia, in specie, ma al 21 con il costituirsi di un ciclone secondario a mm. 753 sull'alto Adriatico, si ha un'altra giornata di venti forti, di direzione varia, per la vicinanza del centro ciclonico.

Dall'esame della rosa dei venti a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Fiume scarse sono le direzioni meridionali comprese nel settore ESE a SW (17 % a 6 direzioni); tra le rimanenti ci sono tre massimi, il principale a N (14 %), un altro a ENE (11 %), un terzo ad WNW (9 %).

A Fiume la grande maggioranza spetta alle direzioni comprese nel settore da ENE a SE (63 % a 4 direzioni), il minimo di queste a ESE con 7 %. Tra le rimanenti sono più frequenti le direzioni comprese nel settore da WNW a NNW (17 % a 3 direzioni) con un massimo a WNW (8 %).

A Venezia scarse sono le direzioni occidentali da N a S (25 % a 9 direzioni); tra le altre spetta un massimo a NNE (25 %) e un altro a SSE (13 %).

Al Venda sono scarse le direzioni comprese nel settore da WNW a NNE (10 % a 5 direzioni); tra le altre trovasi un massimo principale a E (18 %), un altro a SE (9 %) e un terzo a WSW (6 %).

A Padova le direzioni meno frequenti sono quelle meridionali comprese nel settore da ESE a W (10 % ad 8 direzioni); tra le altre si ha un massimo principale a E (16 %) e un altro a N (12 %).

A Trento la rosa ha la solita forma trilobata, però il lobo meridionale è pochissimo sviluppato; ha un massimo a SSE (4 %), un altro ad ENE (19 %, questo è il principale) e un terzo a NNW (16 %).

10. La *media della pressione atmosferica* di questo settembre è superiore al valor normale; difatti l'altezza barometrica di questo mese a Venezia è mm. 764,2, mentre il suo valor normale è mm. 762,5, quindi una differenza di mm. 1,7.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 773,3 alle 11h del 26; il valore minimo è stato di mm. 752,3 alle 5h del 21; l'ampiezza dell'escursione pertanto fu mm. 21,0, alquanto superiore al valore medio della regione che è di 17 mm.

Tra le salite degne di nota và ricordata quella dai mm. 752,3 delle 5h del 22 ai mm. 773,3 delle 11h del 26, mm. 21 in 126 ore, pari a mm. 0,16 all'ora; e quella dai mm. 759 delle 19h del 7 ai mm. 762,5 delle 24h del 7, mm. 3,5 in 5 ore, pari a mm. 0,7 all'ora.

Delle discese riteniamo di ricordare solo quella dai mm. 763,8 delle 8h del 20 ai mm. 752,3 delle 5h del 21, mm. 11,5 in 21 ora, pari a mm. 0,55 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido), ridotte a 0° e al livello del maro.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | I | III | VII | IX | X | XI | XII | XIII | XIV | XV | XVII a | XVII b | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precipit. generali . . | — | — | — | — | — | — | — | — | — | — | — | — | — | 1 | 1 |
| Con precipit. parziali . . | — | 1 | — | 1 | — | — | — | 1 | — | — | — | 1 | 1 | 1 | 6 |
| Senza precipitazioni . . . | 5 | — | 1 | 1 | 6 | 1 | 2 | 2 | 1 | 1 | 1 | — | 2 | — | 23 |
| Totali . . . | 5 | 1 | 1 | 2 | 6 | 1 | 2 | 3 | 1 | 1 | 1 | 1 | 3 | 2 | 30 |

Le precipitazioni che, come abbiamo visto al § 4, si sono manifestate nei giorni dal 14 al 17, furono di natura temporalesca: manifestazioni temporalesche notevoli furono segnalate qua e là in ciascuno di detti giorni. Il 14 sul Mediterraneo centrale si stendeva pressione livellata (tipo XIII); al 15 si stabilisce una depressione sull'Italia meridionale (tipo XVIIb), al 16 si ha una depressione sulle coste del Golfo di Lione; la configurazione si avvicina molto al tipo XV della classificazione adottata, ma non in grado tale da permettere di classificarla, le precipitazioni furono generali. Al 17 pare che la depressione si sia allontanata verso l'Algeria, ma neanche in quel giorno la configurazione è classificabile, e, con quelle del giorno precedente, nello specchietto è stata quindi messa nella colonna segnata con asterisco.

Il grado di nebulosità dell'ultima decade è stato ovunque inferiore ai $^3/_{10}$, perchè, se si eccettui attorno al 24, in cui si ebbero notevoli rannuvolamenti, gli altri giorni furono quasi completamente sereni, e ciò specie dal 25 in poi, quando un notevole anticiclone si stendeva sull'Europa centrale. Questo, nei suoi lenti spostamenti verso SW, al 30 raggiunse la regione balcanica (tipo I), mentre intanto un altro nucleo anticiclonico meno elevato si stendeva sulle coste Mediterranee della Spagna.

12. Piccoli in generale furono gli scostamenti tra la marea prevista in base all'analisi armonica e quella realizzata: i maggiori si sono verificati specialmente durante le basse maree. Le maggiori differenze si ebbero al principio del mese: cm. 20 nella prima bassa marea del 2 e del 3, (reale più bassa della prevista).

La marea reale invece fu più alta della prevista dal 17 al 24, la differenza maggiore si verificò al 21 con cm. 26, negli altri giorni la differenza fu sembre inferiore ai cm. 20.

Al 2 e al 3 una vasta area ciclonica si stendeva sull'Atlantico; essa nei giorni successivi si spostò verso NE.

Al 17-18-19 sull'Adriatico, dominava gradiente settentrionale, ma sulle coste Atlantiche alta pressione, al 21 ciclone sull'alto Adriatico, senza precipitazioni però; dal 22 al 24 gradiente da W sul Mediterraneo occidentale.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

**e per pianure,** limitate dai principali corsi d'acqua della regione e così denominate:

**pianura orientale** { *a*) fra Isonzo e Tagliamento; *b*) fra Tagliamento e Piave

**pianura occidentale** { *a*) fra Piave e Brenta; *b*) fra Brenta e Adige

**pianura polesana** | fra Adige e Po

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.²;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.²;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

Avvertenze. — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

*In questo mese il manto nevoso rimane limitato alle sole località a neve perenne.*

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Belluno* (Borgo Piave), per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(•), dato desunto dalle letture all'idrometro invece che dal registratore;
(••), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Nei valori delle portate e dei deflussi è inoltre considerata la portata, derivata mediante sollevamento meccanico, del canale d'irrigazione di sinistra dell'Adige.

(**) Durante i mesi estivi oltre alle suaccennate derivazioni ve ne sono numerose altre, fra Pescantina e Legnago, le cui portate molto variabili non si possono accertare praticamente. Le portate e i deflussi calcolati per Legnago non sono quindi quelli corrispondenti all'effettivo bacino tributario. Non sono stati calcolati conseguentemente i contributi unitari.

## Misure di portata eseguite nel mese

(1) A causa del moto lentissimo dell'acqua vennero rilevate solamente le velocità superficiali a mezzo di galleggiante. La portata che ne risulta ha quindi valore approssimato. — (2) La misura è stata eseguita sui due rami del ghiacciaio di Malavalle a circa m. 120 dalla confluenza, escludendo il torrente della Vedretta Pendente.

## Materiale in sospensione nell' acqua dei fiumi

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell' I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell' Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera. (1)

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell' alta e della bassa marea.

La torbidità è espressa in ***grammi per metro cubo*** (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) ***ed in salinità*** S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (--), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

(1) Rendendosi necessari alcuni lavori alla stazione mareografica di Marghera, situata all' imboccatura del Canale Vittorio Emanuele III, a fianco dell' Emporio dei Sali e Tabacchi, a partire dal mese di Luglio 1928 sono stati utilizzati per lo spoglio e vengono pubblicati i dati mareografici dei diagrammi della seconda stazione pure di Marghera, situata alla Darsena W.

Le quote dei bulloni di riferimento della nuova stazione sono le seguenti:

Bullone interno m. 2,4707 s. l. m. m.
Bullone esterno m. 2.0687 s. l. m. m.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna è *segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⁎ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - ⁝≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ↔ Aghi di ghiaccio. - ∞ Caligine. - ⩘ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⺄ Vento forte. - ⺄ Vento fortissimo. - ⍭ Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∂ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(•), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

••, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera,* vuol dire che il fenomeno ha durato tutto il giorno.

Avvertenze. — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

# Note meteorologiche del mese di Ottobre

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura*, anche in questo mese, è ovunque superiore al valor medio calcolato da molti anni. Tale differenza è meno marcata che nel mese precedente, difatti solo a Pisino essa raggiunse 1°,5 (valor massimo), a Trieste, Venezia, Vicenza è superiore ad un grado, altrove è inferiore ad uno.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ott. 1929 | 13,0 | 15,8 | 14,2 | 11,8 | 14,4 | 15,4 | 13,9 | 12,1 | 14,7 | 14,3 | 12,4 | 12,6 |
| Val. medio | 11,5 | 14,4 | 13,3 | 10,9 | 14,1 | 14,1 | 13,3 | 11,2 | 14,0 | 13,1 | 12,1 | 12,2 |

2. La temperatura, che negli ultimi giorni del mese precedente aveva ripreso a crescere, raggiunse ovunque un massimo, massimo principale del mese, tra il 3 e il 5 di questo; la temperatura massima diurna fu: al 3 a Venezia 24°,5, al Venda 22°,5, al 4 nella maggior parte delle località (Padova 26°,7) e specie in montagna. In seguito la temperatura andò diminuendo; raggiunse un primo minimo attorno al 10, quando il cielo si rasserenò dopo un periodo d'intemperie; un secondo minimo verso il 20. Negli ultimi 5 giorni del mese la temperatura è in forte e rapida diminuzione; dal 28 in poi è segnato il minimo principale. La minima diurna al 28 è al Venda 2°,4, al 29 a Padova 1°,9, a Venezia 7°,0, ecc.

L'escursione mensile della temperatura pertanto è 20°,1 al Venda, 17°,5 a Venezia, 24°,8 a Padova.

3. In 16 giorni la temperatura minima al Venda fu superiore a quella di Padova, la massima fu sempre inferiore; ciò sta a denotarci l'esistenza nelle ore notturne e nelle prime ore del mattino di un'*inversione termica*, ossia temperatura più bassa in pianura, più alta in collina. Queste inversioni si sono presentate in due gruppi principali, e alcune singolarmente. Il primo gruppo è la continuazione del gruppo iniziatosi al 19 del mese precedente e, senza alcuna interruzione, va sino al 5; notevoli specialmente furono: l'inversione dell'1, in cui la differenza Venda-Padova fu 6°,9 e quella del 2 in cui tale differenza fu 4°,4.

Il secondo gruppo importante va dall'11 al 18; le differenze maggiori sono 5°,1 al 16, e 5°,0 al 17. Si hanno poi inversioni minori al 20, al 24 e al 29.

*L'altezza media dell'isoterma zero*, calcolata utilizzando la temperatura media decadica del Venda e come decremento della temperatura lungo la verticale quello calcolato per l'aria libera in Val Padana, nella prima decade è verso i 3200 metri, nella seconda verso i 2800 e nella terza scende verso i 2200. Tale altezza riesce ancora minore specie nella terza decade se la si calcola direttamente dagli Osservatori meteorologici e dalle stazioni termometriche della regione. Difatti distribuiti questi in vari gruppi a seconda della loro quota, si hanno i valori medi riportati nel seguente specchietto:

| Altezza m. sul livello del mare | 31 | 311 | 576 | 946 | 1250 | 1508 | 1822 | 2152 |
|---|---|---|---|---|---|---|---|---|
| Numero di stazioni . . . . | (15) | (10) | (8) | (12) | (14) | (12) | (7) | (3) |
| Temper. media prima decade . | 18,2 | 15,2 | 13,5 | 12,8 | 10,2 | 9,3 | 7,2 | 5,1 |
| Temper. media seconda decade . | 15,0 | 12,2 | 10,6 | 10,1 | 8,4 | 7,9 | 6,7 | 2,7 |
| Temper. media terza decade . . | 12,9 | 9,6 | 7,9 | 7,0 | 4,6 | 4,0 | 2,4 | –1,0 |
| Temperatura media mensile . . | 15,4 | 12,3 | 10,7 | 9,9 | 7,7 | 7,1 | 5,4 | 2,3 |

4. Continua sino al 5 il periodo asciutto del mese precedente. Dal 6 al 10 decorre un periodo piovoso a precipitazioni generali nei primi tre giorni, parziali negli altri due.

Dopo altri 7 giorni, al 18 riprendono le precipitazioni che durano sino al 21, generali solo al 19; al 20 invece quasi generali e dopo altri tre giorni, quasi asciutti, nei quali cadde qualche precipitazione nella sola Istria, riprendono al 25 le precipitazioni; queste, salvo un giorno d'interruzione (il 29), continuano sino alla fine del mese.

Tra le precipitazioni degne di nota vanno ricordate quelle del 9 (g. p.) mm. 174,2 a Tramonti di Sopra (*totale diurno massimo del mese*). Anche il giorno successivo (10) nel bacino dell'Isonzo le precipitazioni furono abbondanti: Plezzo mm. 77,4, Caporetto mm. 54,8, ecc.

Altra giornata a precipitazioni abbondanti nella Venezia Giulia fu il 26 (g. p.) mm. 122,4 a Plezzo, mm. 153,8 a Venzone.

Mentre le variazioni del Livenza, Piave, Bacchiglione, Agno Guà, Adige furono sempre piccole, trascurabili, invece l'Isonzo e il Tagliamento ebbero un leggero incremento al 9, un altro al 20 e un terzo (il maggiore) al 26, Isonzo m. 3,72 all'idrometro di Caporetto, e al 27 il Tagliamento m. 2,80 all'idrometro di Latisana.

5. Nell'ultima decade le precipitazioni a quote superiori ai 1500 m. furono in forma di *neve*, ma, mentre sotto ai 2000 m. esse presto si scioglievano, oltre i 2000 il suolo rimase coperto per lo più dapertutto. Lo spessore del manto nevoso raggiunse cm. 110 al 25 a Monteneve, e mm. 75 all'ultimo del mese.

6. La *media mensile della nebulosità* a Bolzano e Pisino è alquanto superiore al valor medio dedotto da molti anni; altrove è inferiore. La differenza è più forte a Rovigo, Trieste, Venezia.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Ott. 1929 | 5,9 | 4,7 | 5,7 | 4,6 | 5,6 | 4,7 | 5,7 | 4,9 | 5,2 | 5,7 | 5,8 |
| Val. medio | 5,1 | 5,7 | 5,7 | 6,2 | 5,6 | 6,3 | 5,5 | 6,1 | 5,1 | 5,6 | 4,9 |

7. Il confronto tra la *pioggia* caduta in questo ottobre e il valor normale dà valori differenti per le varie parti delle tre Venezie. Mentre nel cuore dell'Istria e sul Carso (Trieste, Gorizia), nella pianura Veneta orientale e a Venezia si hanno valori superiori all'unità; nella pianura Veneta occidentale e lungo la costa meridionale e quella orientale dell'Istria si hanno rapporti inferiori all'unità (Rovigo 0,41, Fiume 0,73).

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Ott. 1929 | 163,7 | 176,2 | 81,1 | 143,0 | 175,0 | 500,6 | 195,8 | 136,2 | 117,0 |
| Valore medio | 225,0 | 148,0 | 120,0 | 124,0 | 173,0 | 320,2 | 124,7 | 102,6 | 106,9 |
| Rapporto | 0,73 | 1,19 | 0,68 | 1,15 | 1,00 | 1,55 | 1,57 | 1,32 | 1,09 |

| | Venezia | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|---|
| Ott. 1929 | 104,4 | 104,4 | 44,2 | 103,9 | 201,6 | 131,6 | 171,5 | 100,6 | 31,0 |
| Valore medio | 69,8 | 90,2 | 106,7 | 140,7 | 295,0 | 132,9 | 130,3 | 85,1 | 58,0 |
| Rapporto | 1,50 | 1,14 | 0,43 | 0,73 | 0,68 | 0,99 | 1,31 | 1,19 | 0,53 |

8. Nell'esame della carta delle precipitazioni lungo le prealpi Venete si notano tre aree di massimo molto pronunciate; una sui Lessini (mm. 334 a Pian delle Fugazze), un'altra sulle Prealpi carniche a Sud dell'Alto Tagliamento (mm. 615 Tramonti di Sotto, mm. 597 Rio Stavalins) e una terza alquanto più ad oriente della precedente che comprende Passo Resia (mm. 520), Plezzo (mm. 506), Musi (mm. 682), Uccea (mm. 693, *totale massimo del mese*). Sulla fascia determinata da questi massimi, nei tratti tra massimo e massimo, ci sono parecchie località in cui il totale è sotto ai 200 mm.

Sulle alpi Giulie una prima area di massimo trovasi tra Idria e Gorizia e un'altra attorno al Monte Nevoso (Cà di Caccia mm. 512).

Nella pianura veneta ad occidente del Brenta le precipitazioni sono inferiori a 100 mm.; nella pianura friulana superano i 200 mm. Udine mm. 253, Maruzzo mm. 287, ecc.

Nell'Istria le precipitazioni sono tra 70 e 100 mm. in una piccola striscia attorno alla foce del Quieto, nella Punta Meridionale comprendente Rovigno e una striscia attorno all'alto bacino dell'Assa; il rimanente è oltre 100 mm.; il maggior valore si ha a Lupogliano mm. 198, ecc.

Nella regione Alpina la Val Venosta costituisce un'area di minimo sotto ai 50 mm.; ci sono qua e là aree oltre i 100 mm.; un'area ristretta attorno a Passo Rolle oltre i 200 mm. (Passo Rolle mm. 205, Cauria mm. 205).

9. La *media diurna della velocità del vento* ha raggiunto e superato i 20 km. ora al Venda in 13 giorni e precisamente il 3-4-7-8-9-19-20-25-26-27-28-30-31, a Venezia in solo 4 giorni, il 26-27-28-31, a Trieste in 4 giorni 10-20-28-31, vario negli altri due giorni.

Il giorno a media più elevata al Venda è stato il 26 con 32,4 km. ora, quando sulla regione si stendeva un ciclone secondario; il giorno 28 è stato il più ventoso nelle altre località; Venezia 29,0, Trieste 37,6 (al Venda 31,0). Anche a Padova fu il giorno più ventoso con 29,3 km. ora. In quel giorno il vento ovunque fu tra ENE e NE e al Venda fu segnato il percorso orario massimo del mese (km. 68).

La regione era sotto la duplice azione di un promontorio a Nord delle Alpi che con la sua testa era avanzato sino alla pianura ungherese, mentre sul medio Tirreno trovavasi un ciclone a mm. 754, costituendo tra Venezia e Firenze una differenza di pressione di 4 mm. Si riversava pertanto sulle nostre regioni con violenza l'aria fredda dell'Europa centrale, apportandovi le temperature minime del mese.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo risulta:

A Trieste la rosa ha la sua solita forma: la maggiore frequenza spetta alle direzioni comprese nel settore tra SE ed ENE (66 % a 4 direzioni), con due massimi uno a SE (23 %) ed uno a E (20 %); il massimo secondario spetta alle direzioni comprese nel settore tra NW e SW (21 % a 5 direzioni).

Al Venda le direzioni prevalenti si distribuiscono su due settori: uno orientale con massimo a ENE (14 %) e un altro occidentale con un massimo ad WSW (16 %) minimo a N e NNW (con 2 % per ciascuno) e un altro minimo a SSW (3 %), e un terzo a ESE (4 %). Le tre direzioni intermedie a questi due minimi, ossia S, SSE, SE, hanno complessivamente 16 %, distribuita quasi uniformemente fra le 3.

A Venezia il massimo principale spetta a ENE (26 %), un altro a WSW (12 %) e un terzo a SSE (13 %). I minimi intermedi sono NW (2 %), SW (3 %), E (1 %).

A Padova il settore della maggiore frequenza è compreso tra NE e WNW (59 % a 6 direzioni), il massimo è a N (12 %); tra le rimanenti vi è un altro settore abbastanza frequente tra WSW e S (20 % a 4 direzioni, con quasi uguale frequenza), minimo a E (1 %) e un altro a W (3 %).

10. La *media mensile della pressione atmosferica* di questo ottobre è alquanto inferiore al valor normale; difatti l'altezza barometrica di questo mese a Venezia è mm. 760,9 mentre il suo valor normale è mm. 762,0; quindi una differenza di mm. 1,1.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 771,0 alle 10h del 14; il valor minimo è stato di mm. 746,7 alle 14h del 26; l'ampiezza dell'escursione pertanto è stata di mm. 24,3, leggermente superiore al valor dell'escursione media che spetta a questo mese nella regione, e che è attorno ai 23 mm.

Tra le salite degne di nota vanno ricordate; quella dai mm. 756,3 delle 18h del 9, ai mm. 765,2 delle 11h del 10, mm. 8,9 in 17 ore, pari a mm. 0,52 all'ora, e quella dai mm. 755,3 delle 4h del 28 ai mm. 760,4 delle 8h del 28, mm. 5,1 in 4 ore, pari a mm. 1,28 all'ora.

Tra le discese degne di nota vanno ricordate: quella dai mm. 771,0 dalle 10h del 14 ai mm. 753,2 delle 24h del 19, mm. 17,8 in 134 ore, pari a mm. 0,13 all'ora, e quella dai mm. 754,7 delle 11h del giorno 25 ai mm. 747,0 delle 8h del 26, mm. 7,7 in 16 ore pari a mm. 0,48 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido) ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

L'anticiclone sulle coste mediterranee della Spagna alla fine del mese scorso andò accentuandosi al principio di questo (mm. 770 sulle coste meridionali spagnole l'1 e il 2) e, lentamente spostandosi verso levante lungo il Mediterraneo, raggiunse il mar Egeo, e il Mar nero al 5. Intanto un ciclone settentrionale interessava la parte occidentale del Mediterraneo con una estesa saccatura e al 6 ha inizio un periodo piovoso. La depressione del Mediterraneo d'accordo con un ciclone settentrionale si sposta verso levante, mentre attraverso il Golfo di Guascogna avanza un anticiclone atlantico. All'11, quando il ciclone ha raggiunto il Mar di Levante e a Nord delle Alpi si stende un promontorio da W, ritorna il sereno. L'anticiclone, che ha invaso l'Europa centrale al 13, prosegue molto lentamente il suo movimento spostandosi verso SE nel Mediterraneo, dove vi apporta pressione livellata al 17. Intanto il ciclone nordico al 18 centrato nel Mar del Nord a mm. 747, stendendo la sua azione anche sull'Europa centrale (tipo III), manda una saccatura nel Mediterraneo occidentale e riprendono le precipitazioni, che continuano nei giorni successivi sino al 21. Al 22 la nostra regione è passata sotto l'azione del promontorio protendentesi dall'anticiclone atlantico sino a Nord delle Alpi, mentre il ciclone atlantico ch'era approdato alle coste di Francia a mm. 745 il 21, procede attraverso le isole Baleari (22), è sulle tirreniche il 23, e raggiunge l'Albania il 24. Ritornano nuovamente le precipitazioni al 25 e continuano nei giorni successivi, quando il ciclone nordico che è a mm. 732 sul Mar di Norvegia al 25, passa a mm. 747 nel Mar del Nord il 27, a mm. 750 sulla Bretagna con un secondario a mm. 754 sul Tirreno medio il 28. Quest'ultimo è sulla Calabria al 29, per poi tornare nel Tirreno al 30 e 31. Oltre che piovose queste giornate furono anche a vento forte di primo quadrante.

12. Nei primi 5 giorni del mese e dal 13 al 18 la marea reale si mantiene in genere più bassa di quella prevista con l'analisi armonica, negli altri giorni più alta. Le differenze maggiori si hanno dal 25 al 29, raggiungendo un massimo di 45 cm. nei giorni 25 e 26.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e **per pianure,** limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.$^2$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.$^2$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(*), dato desunto dallo strumento a lettura diretta invece che dal registratore.

Avvertenze. — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Segusino*, per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(*), dato desunto dalle letture all'idrometro invece che dal registratore;
(**), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(1) Dalle portate giornaliere del mese di Settembre vanno detratti in media mc. 1.60. Conseguentemente i valori espressi in calce alla pagina rimangono così modificati: deflusso totale mensile 42025, portata media mensile 16.2; contributi: media mensile 21.9, massimo 39.5, minimo 12.2.

(2) Non si possono ancora calcolare i deflussi mancando la relazione fra altezze idrometriche e portate in conseguenza di lavori che hanno modificato l'alveo nella sezione di misura.

(*) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Per la stazione di Legnago non sono calcolati i contributi unitari in conseguenza delle rilevanti perdite per infiltrazione che si verificano nell'alveo nel tratto Pescantina-Legnago.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

(1) La portata è stata calcolata in base alle sole velocità superficiali. — (2) In conseguenza della diversione del T. Rai dal bacino del Piave a quello del Lago S. Croce-Livenza, la superficie del bacino imbrifero del Piave a Ponte nelle Alpi resta attualmente così modificata. — (3) Non è compresa la portata del Canale derivato dal Piave a Soccher.

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

| STAZIONE | | Quota del pelo d'acqua nel giorno | | | | | | | | | | | Livello medio | Indicazioni idrografiche | | |

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera.

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (··), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte «Meteorologia», a differenza di quello che si fa nell'altra parte «Pluviometria», si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris (1) alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⁎ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≑ Nebbia. - ≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ←- Aghi di ghiaccio. - ∞ Caligine. - ⊼ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ⚡ Lampi e tuoni. - ⇂ Vento forte. - ⇂ Vento fortissimo. - + Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

··, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

**Avvertenze.** — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

(1) C. Fabris — Tipi isobarici principali e loro azione sull'Italia — Lit. del Serv. Aer. - 1917.

# Note meteorologiche del mese di Novembre

(Redatte dal Prof. Dott. G. Crestani)

1. La *temperatura media mensile* di questo novembre ovunque è superiore al valor medio dedotto da molti anni. L'eccesso è di 2°,0 a Vicenza e a Pisino, 0°,6 a Bolzano, 0°,7 al Venda, 0°,8 a Trento; altrove è compreso tra questi valori.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Nov. 1929 | 8,3 | 11,1 | 9,9 | 6,5 | 9,2 | 9,9 | 8,7 | 6,5 | 9,0 | 9,2 | 6,3 | 6,1 |
| Val. medio | 6,3 | 9,3 | 7,8 | 4,6 | 7,8 | 8,0 | 7,2 | 5,8 | 7,6 | 7,2 | 5,5 | 5,5 |

2. Quasi ovunque la temperatura media della terza decade è leggermente inferiore a quella della prima; quella della seconda poi è la più bassa di tutte: in questo periodo si ebbero i maggiori freddi del mese; il termometro raggiunse il limite inferiore il 15 al Venda 1°,5, il 16 a Padova 0°,1, a Venezia 3°,3; nell'interno della zona montuosa, anche alle quote più basse, scese sotto zero (Bolzano −0°,1, Trento −0°,9, ecc). La temperatura si mantenne bassa anche nei giorni successivi, tanto che in qualche località il minimo fu raggiunto al 20 e al 21.

Il limite più alto fu raggiunto dal termometro quasi ovunque ai primi giorni del mese; all'1 a Bolzano, al 2 a Pisino ecc., al 5 a Padova con 14°,7, al 7 a Venezia con 14°,7, ecc. Solo in poche località tale limite fu segnato al 23 (Venda 10°,7).

L'escursione tra gli estremi in questo mese fu 14°,6 a Padova, 11°4 a Venezia, 9°,2 al Venda.

3. In 8 giorni la temperatura minima al Venda fu superiore a quella di Padova, la massima fu sempre inferiore; ciò sta a denotarci l'esistenza nelle ore notturne e nelle prime ore del mattino di un'*inversione termica*, ossia temperatura più bassa in pianura, più alta in collina. La frequenza in questo mese è minore di quella solita, e ciò per il forte numero di giorni con precipitazioni nei quali di regola manca l'inversione.

Tali inversioni si presentarono nei giorni 15, 16, 19, 20, 21, 22, 27, 28. Notevole fu specialmente l'inversione del 20, in cui la differenza Venda-Padova fu di 4°,3.

L'*altezza dell'isoterma zero*, calcolata utilizzando la temperatura media decadica del Venda e come decremento della temperatura quello calcolato per l'aria libera in Val Padana, nella prima e nella terza decade è a m. 2250; invece si mantiene verso i 1900 nella seconda decade.

Tale altezza riesce minore specie nella seconda decade, se la si calcola direttamente dagli Osservatori meteorologici e dalle stazioni termometriche della regione. Difatti distribuiti gli Osservatori e le stazioni in vari gruppi a seconda della loro quota, si hanno alle varie quote per la temperatura i valori medi riportati nel seguente specchietto.

| Altezza m. sul livello del mare | 31 | 311 | 576 | 1030 | 1257 | 1517 | 1822 | 2152 |
|---|---|---|---|---|---|---|---|---|
| Numero di stazioni | (15) | (10) | (8) | (12) | (13) | (10) | (7) | (3) |
| Temper. media prima decade | 11,5 | 8,1 | 6,5 | 5,5 | 3,3 | 2,9 | 1,7 | −0,7 |
| Temper. media seconda decade | 9,5 | 5,9 | 4,4 | 3,2 | 0,7 | −0,3 | −0,9 | −4,0 |
| Temper. media terza decade | 10,2 | 6,5 | 5,1 | 4,6 | 2,8 | 2,8 | 1,4 | −1,9 |
| Temperatura media mensile | 10,4 | 6,8 | 5,3 | 4,4 | 2,3 | 1,8 | 0,7 | −2,2 |

All'ispezione di questo specchietto appare come la isoterma 0° sia attorno ai 2000 metri nella prima e terza decade, ma invece scenda verso i 1400 nella seconda decade.

4. Pochi sono i giorni in cui in qualche parte della regione non si siano verificate le precipitazioni e questi sono il 19-20-21-22, i quali col 15-16-17 costituiscono il periodo asciutto più lungo del mese, interrotto da un giorno con piogge parziali al 18. Possono essere ascritti tra gli asciutti per le scarsissime precipitazioni anche il 5-7-9-25 e 28.

Tra le precipitazioni più copiose vanno segnate quelle del 3: Fiume mm. 69,0, Conegliano mm. 47,0; quelle del 14 (g. p.): Plezzo mm. 56,8, Montenero d'Idria mm. 78,0 (*totale diurno massimo del mese*).

Attorno a quei giorni vi furono aumenti dei fiumi alquanto sensibili; il più accentuato quello del Livenza che all'idrometro di Motta al 4 raggiunse cm. 176.

5. Dopo avere subite nel corso del mese variazioni notevoli, il *manto nevoso* alla fine ha uno spessore leggermente superiore a quello del mese precedente, così a Monteneve cm. 108 in luogo di 70, a Passo l'ordoi cm. 60 in luogo di 45, ecc. Non ha subito variazioni sensibili il livello delle nevi che rimane verso i 1500 metri. Più in basso, durante i periodi piovosi, nell'interno della zona montuosa, specie nella Tridentina, cadde talora la neve, sempre però frammista all'acqua senza accumularsi al suolo.

6. La media mensile della *nebulosità* in questo novembre è ovunque notevolmente superiore al valor medio dedotto da molti anni.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Nov. 1929 | 7,4 | 7,0 | 6,9 | 5,8 | 7,4 | 7,1 | 7,4 | 7,3 | 8,1 | 7,3 | 7,2 |
| Val. medio | 5,0 | 5,7 | 5,4 | 5,8 | 5,7 | 6,5 | 5,7 | 5,3 | 7,0 | 5,6 | 4,4 |

7. Abbondanti quasi da per tutto furono le *precipitazioni*: in qualche località fu superato notevolmente il valor nornale; nell'Istria e nel Veneto centrale il rapporto tra totale di questo mese e valor normale s'aggira attorno a 2; tale rapporto è leggermente inferiore all'unità nel bacino dell'Isonzo (Gorizia 0,84, Plezzo 0,67) e in generale nell'Alto Adige (Trento 0,86, Bolzano 0,84).

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |

8. Dall'esame della carta delle precipitazioni appare che in pianura i 150 mm. furono superati solo in un'area che comprende il versante nord orientale dei Colli Berici ed Euganei e si protende in una striscia ristretta comprendente Padova (mm. 154), sin quasi presso Castelfranco (mm. 135). Tale limite di 150 mm. fu superato in misura notevole in talune aree lungo la fascia dei massimi. Una prima di queste aree trovasi sui Lessini (mm. 183 a Laghi, mm. 171 a Lambre d'Agni), una seconda sulle Prealpi Bellunesi (mm. 237 a Milies, mm. 179 a Cison), una terza, più ampia delle precedenti, comprende le sorgenti del Cellina, del Meduna e l'alto Tagliamento (mm. 242 ad Andreuzza e mm. 287 a Frasseneit).

Tutte le alpi Giulie e l'Istria intera sono oltre mm. 150. L'isoieta 400 racchiude la Selva di Tarnova e la Selva di Piro (mm. 472 a Pocrai; mm. 499 a Predmeia, *totale mensile massimo del mese*).

L'isoieta 300 racchiude i monti della Vena e parte della regione Liburnica (Vodizze mm. 350).

L'isoieta 100 nella zona montuosa, partendo poco a Sud di Trento e poi movendo sensibilmente parallela all'Avisio in direzione SW-NE, raggiunge il confine politico nei pressi di Forni Avoltri; da questa isoieta procedendo verso NW la precipitazione va in generale diminuendo con la solita area di minimo nella Val Venosta.

9. La *media diurna della velocità del vento* ha raggiunto e superato i 20 km./ora: al Venda in 13 giorni (1-2-3-5-6-10-11-14-15-17-18-19-21), a Venezia in 4 giorni (1-11-14-25), a Trieste in 10 giorni (1-3-5-6-11-15-18-19-20-21). A Venezia la media diurna più alta fu km. ora 29,1, al Venda km. ora 47,6 (anche in altri 2 giorni furono superati 40 km. ora), a Trieste il massimo fu 51,8 al 18 (in altri 2 giorni furono superati i 40). La direzione del vento in tutti questi giorni fu compresa tra E e NE, tranne che al 14 in cui fu da WSW a Venezia e al Venda, a Trieste invece spirava vento debole e vario. Il *percorso orario massimo* fu di km. 74 al Venda, di 70 a Trieste, di 50 a Venezia, ovunque nello stesso giorno, all'1.

Dall'esame della *rosa dei venti* a 16 direzioni, costruita con lo spoglio orario delle registrazioni dell'anemografo, risulta:

A Fiume la maggiore frequenza spetta alle direzioni tra NNW e ENE, 64 % a 5 direzioni, con un massimo (16 %) a N. Tra le altre ci sono due massimi: uno a ENE (10 %), e l'altro a WNW (7 %).

A Trieste la maggiore frequenza spetta alle direzioni del settore da ENE a SE (75 % a 4 direzioni), con un massimo a ENE (28 %).

A Venezia la maggiore frequenza spetta alle direzioni da WSW a ENE (88 %), con un massimo a ENE (31 %).

A Padova la maggiore frequenza spetta alle direzioni comprese nel settore che va da SW per W a NE (79 % a 9 direzioni), con un massimo a N (17 %).

Al Venda le direzioni si distribuiscono in due settori, quasi fra loro opposti; le più frequenti sono quelle orientali; difatti alle tre direzioni NE, ENE, E spetta 58 % con un massimo di 31 % a ENE; alle 5 direzioni comprese tra NNW e SW spetta 27 % con un massimo 8 % a WNW.

A Trento mancano quasi del tutto le direzioni meridionali; alle direzioni comprese tra NE e NW spetta 74 % a 5 direzioni.

10. La *media della pressione atmosferica* anche in novembre è alquanto inferiore al valor normale. Difatti l'altezza barometrica di questo mese a Venezia è stata di mm. 761,7, mentre il suo valor normale è mm. 762,6; una differenza pertanto di mm. 0,9.

Il valor massimo raggiunto dall'altezza barometrica è stato mm. 770,3 alle 24h del 3, e il valor minimo mm. 746,0 alle 15h del 14; l'*ampiezza dell'escursione*, pertanto, è stata di mm. 24,3, leggermente inferiore al suo valor normale nella regione, che è di mm. 25.

Tra le *salite* del barometro degne di nota vanno ricordate: quella dai mm. 752,9 delle 13h del 18 ai mm. 765,1 delle 11h del 19, mm. 12,2 in ore 22, pari a mm. 0,55 all'ora; e quella dai mm. 758,7 delle 14h del 3 ai mm. 762,8 delle 18h del 3, mm. 4,1 in 4 ore, pari a mm. 1,03 all'ora.

Tra le *discese* del barometro degne di nota vanno ricordate: quella dai mm. 763,9 delle 11h del 22 ai mm. 757,8 delle 14h del 14, mm. 6,6 in 64 ore, pari a mm. 0,13 all'ora; e quella dai mm. 762,5 delle 9h del 3 ai mm. 758,9 delle 14h dello stesso giorno, mm. 3,6 in 5 ore, pari a mm. 0,72 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio a Venezia (Lido), ridotte a 0° e al livello del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | I | II | III | IIIa | IV | V | VI | XI | XII | XIII | XVIa | XVIb | XVIc | XVIIa | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con prec. gen. | — | 1 | — | 1 | 2 | — | — | — | — | — | 1 | 1 | 2 | — | — | 2 | 10 |
| Con prec. parz. | — | 1 | 1 | — | 1 | 1 | 1 | — | — | 1 | — | — | — | 1 | 1 | — | 8 |
| Senza precipit. | 1 | 1 | 1 | 1 | — | — | — | 3 | 2 | — | — | 1 | 1 | — | — | 1 | 12 |
| Totali | 1 | 3 | 2 | 2 | 3 | 1 | 1 | 3 | 2 | 1 | 1 | 2 | 3 | 1 | 1 | 3 | 30 |

La situazione isobarica dell'Europa in questo mese può dirsi caratterizzata dai seguenti fattori: una quasi sedentarietà di due aree di alta pressione; di queste una proveniva dall'Atlantico e si stendeva sulla parte meridionale della penisola iberica e sulla parte occidentale dell'Africa settentrionale (Marocco, Algeria e talora, in qualche giorno si estese anche sino alla Tripolitania); pure sulla Russia centrale si ebbe quasi sempre un'area d'alta pressione che talora (al 19-20) si estese verso l'Europa Centrale.

D'altra parte sull'Europa nord occidentale in generale, tra la Groenlandia e le isole Britanniche, si trovarono quasi sempre cicloni, talora profondi, ai quali gli anticicloni precedenti definivano la propagazione verso NE (regioni polari), o verso SE (Mediterraneo). Il Mediterraneo fu frequentissimamente sede di formazioni secondarie, il cui movimento ebbe la solita irregolarità loro caratteristica in questo mare.

E' degno di nota il presentarsi di precipitazioni anche quando il ciclone trovavasi nel basso Tirreno (tipo XVIc al 10-11-12) per la quale situazione nelle tre Venezie, di regola, si ha vento settentrionale e assenza di precipitazioni.

Giova ricordare anche che si ebbe una situazione ben definita, ma tanto rara che non trova posto nella classificazione che abbiamo adottato e precisamente la saccatura da W attraverso le alpi Graie nella Val Padana nel giorno 13, accompagnata da precipitazioni.

Alle numerose formazioni, testè ricordate, in vicinanza delle coste Italiane vanno ascritte le copiose precipitazioni e i venti forti segnalati in questo mese.

12. In tutto il mese, quando più quando meno, la marea reale è sempre più alta di quella prevista con l'analisi armonica; fa eccezione la sola alta marea del 15.

Nei primi due giorni le differenze furono forti (50 cm. alta marea dell'1); queste differenze però vanno attenuandosi nei giorni successivi e sono pressochè nulle dal 4 al 10 (periodo di quadratura). Successivamente esse si mantengono in generale tra i 10 e i 20 cm. sino al 24, con un massimo tra 40-50 cm. nei due giorni 18-19, successivi a luna piena. Dal 25 alla fine del mese differenze inferiori ai 10 cm.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure**, limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento<br>*b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta<br>*b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.$^2$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.$^2$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
n, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(•), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Venzone* e *Latisana*, per il **Piave** a *Segusino*, per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani*.

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;

?, dato incerto;
(·), dato desunto dalle letture all'idrometro invece che dal registratore;
(··), dato interpolato;

°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata è anche considerata quella del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera-estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera-estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Per la stazione di Legnago non sono calcolati i contributi unitari in conseguenza delle rilevanti perdite per infiltrazione che si verificano nell'alveo nel tratto Pescantina-Legnago.

## Misure di portata eseguite nel mese

| N. d'ordine | Bacino principale | Corso d'acqua | Località | Giorno | Idrometro | Altezza idrometrica | Sezione liquida in mq. | Portata m. c. al secondo | Bacino imbrifero in kmq. | Contributo per kmq. in litri |

(1) La portata è stata calcolata in base alle sole velocità superficiali. — (2) Non è compresa la portata del Canale derivato dal Piave a Soccher.
N.B. — Per esigenze tipografiche si rimanda al mese di Dicembre la pubblicazione delle rimanenti misure di portata eseguite in Novembre nel bacino dell'Adige.

## Materiale in sospensione nell' acqua dei fiumi

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

### SEGNI CONVENZIONALI

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

Tabelle I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

Tabella III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera.

Tabella IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna), Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

Tabella V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.³).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

### SEGNI CONVENZIONALI

», dato mancante; — (--), dato interpolato o calcolato in base ad osservazioni interpolate; — ?, dato incerto.

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Dei vari Osservatori costituenti la Rete Meteorologica del Magistrato alle Acque si pubblicano le osservazioni di alcuni soltanto, scelti in modo da dare un'idea sull'andamento dei principali fenomeni meteorologici della Regione che hanno interesse più o meno diretto con l'Idrologia. Gli stessi criteri hanno servito per la scelta delle stazioni termometriche.

Le osservazioni nella Rete del Magistrato alle Acque si eseguono alle ore 8, 14 e 19 T. M. E., in accordo con l'orario internazionale per le osservazioni sinottiche.

Tutti gli Osservatori sono muniti di strumenti registratori, e alle ore indicate si fanno le letture, tanto ad essi, come agli strumenti a lettura diretta, in modo da apportare in seguito le correzioni del caso.

*Gli strumenti registratori* da cui si fanno gli spogli sono:

*per la pressione:* il barometrografo Agolini;

*per la temperatura:* il termografo, e *per l'umidità:* l'igrografo, tutti e due della ditta Richard;

*per il vento:* l'anemografo Steffens - Marini, ovunque, tranne all'Osservatorio di Treviso e quello del Lido, ove lo spoglio è desunto da un anemografo ad 8 direzioni del Richard;

*per le precipitazioni:* pluviografo Palazzo, oppure tipo M dell'Ufficio Idrografico.

Negli Osservatori principali sono in funzione anche altri tipi di registratori, ai quali si ricorre per l'eventuale interpolazione dei dati, nel caso d'interruzione agli strumenti comuni.

Gli strumenti, tarati all'atto della distribuzione, vengono di quando in quando verificati e controllati.

**Per tutti gli elementi meteorologici, di cui si dà conto nella presente parte « Meteorologia », a differenza di quelle che si fa nell'altra parte « Pluviometria », si adotta il giorno civile dalle 0 alle 24.**

Dei diagrammi del termografo, igrografo, barografo si fa lo spoglio, ossia la lettura delle ordinate, ogni due ore.

La media relativa viene calcolata con la formula:

$$m = \frac{1}{12}(l_0 : 2 + l_2 + l_4 + \ldots + l_{22} + l_{24} : 2)$$

Alla media così calcolata si apporta la *correzione* ricavata dal diagramma delle correzioni, ottenuto portando sulle ascisse le letture fatte sul registratore, e sulle ordinate le correzioni dedotte dai confronti con le osservazioni agli strumenti a lettura diretta. Tale metodo si è trovato più rapido e più opportuno di quello di applicare giorno per giorno la correzione ricavata, oppure alla media dell'elemento la media aritmetica delle correzioni.

Per il *vento* si fa lo spoglio ogni ora.

Nella relativa colonna *è segnata la direzione prevalente del vento,* ossia la direzione secondo la quale esso ha soffiato per un maggior numero di ore durante la giornata.

La *media giornaliera* della velocità del vento, espressa in km. ora, è calcolata secondo la formula:

$$m = \frac{1}{24}(l_1 + l_2 + \ldots + l_{23} + l_{24})$$

Per due Osservatori, Belluno, Vicenza e per quelli di II° ordine, non ancora forniti di anemografo, la direzione e forza del vento sono stabilite a stima dall'osservatore.

Per ogni Osservatorio viene pubblicato la massima e minima temperatura giornaliera.

La *nebulosità* è espressa in decimi di cielo coperto, ed è la media aritmetica delle tre osservazioni.

*Note meteorologiche del mese.* — Vengono suggerite dall'esame dei dati raccolti negli Osservatori meteorologici e nelle Stazioni pluviometriche del Compartimento, e delle carte isobariche che si pubblicano nel Bollettino giornaliero dell'Ufficio; queste carte vengono talvolta rettificate in base alle pubblicazioni degli Uffici Meteorologici italiani ed esteri.

I numeri romani preceduti o no dalla parola - tipo - si riferiscono alla classificazione del Fabris [1] alla quale sono state portate leggere modifiche specialmente nei riguardi dei tipi III, XV e XVII.

I valori medi dei vari elementi meteorologici sono stati desunti in generale dai lavori del Prof. F. Eredia pubblicati negli Annali dell'Ufficio Centrale di Meteorologia e Geodinamica di Roma e si riferiscono ad oltre un trentennio di osservazioni. Soltanto per il Venda i valori medi sono stati dedotti da un decennio di osservazioni.

### SEGNI CONVENZIONALI

● Pioggia. - ⚹ Neve. - △ Nevischio. - Gragnuola - ▲ Grandine. - ≡ Nebbia. - !≡ Nebbia piovigginosa. - ≡ Nebbia all'orizzonte. - V Brina. - ⌴ Gelo. - ∾ Gelicidio. - ⌓ Rugiada. - ·-- Aghi di ghiaccio. - ∞ Caligine. - ꓘ Temporale. - T Temporale lontano. - < Lampi senza tuoni. - ≷ Lampi e tuoni. - ⺀ Vento forte. - ⺀ Vento fortissimo. - ∔ Uragano di neve. - ⊖ Alone solare. - ∈ Alone lunare. - ⊕ Corona solare. - ∉ Corona lunare. - ⌒ Arcobaleno.

—, calma, o nessuna precipitazione;

», non giunte le osservazioni; dato mancante o non calcolato;

?, dato incerto;

(·), dato desunto dallo strumento a lettura diretta, invece che dal registratore; se il segno è messo in testa ad una decade, vale per tutti i dati successivi di quella decade;

**, dato interpolato o calcolato in base ad osservazioni interpolate;

Le lettere a p n, che seguono alcuni segni (quei di nebbia, pioggia, neve, grandine, temporale, lampi, tuoni), indicano la parte del giorno (rispettivamente dalle ore 8 alle 12, dalle 12 alle 19 e dalle 19 alle 8), in cui il fenomeno si è verificato.

Se il segno di pioggia, neve, nebbia non è seguito da *nessuna lettera*, vuol dire che il fenomeno ha durato tutto il giorno.

Avvertenze. — I valori massimo e minimo dei singoli elementi per ogni decade sono indicati col carattere grassetto.

(1) C. Fabris — Tipi isobarici principali e loro azione sull'Italia — Lit. del Serv. Aer. — 1917.

# Note meteorologiche del mese di Dicembre

(Redatte dal Prof. Dott. G. Crestani)

1. La *media mensile della temperatura*, anche in questo mese, è ovunque in eccesso rispetto al valor medio dedotto da molti anni; tale eccesso è 0°,7 al Venda, è tra 1 e 2 gradi a Pisino, Trieste, Gorizia, Padova; oltrepassa i 3° a Belluno e a Vicenza, ove raggiunge il valor massimo 3°,3.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Venda | Rovigo | Vicenza | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Dic. 1929 | 4,8 | 7,6 | 6,3 | 3,3 | 5,7 | 6,4 | 4,9 | 3,8 | 5,0 | 6,1 | 3,7 | 3,3 |
| Val. medio | 3,5 | 6,0 | 4,5 | 0,0 | 3,6 | 4,0 | 2,9 | 3,1 | 3,0 | 3,0 | 0,9 | 0,9 |

2. Come *andamento generale* nella regione si può riconoscere che la temperatura nei primi giorni del mese è leggermente crescente, in modo da raggiungere i valori massimi attorno al 10; il massimo assoluto a Gorizia fu segnato il 7, a Belluno il 9, a Padova il 13 con 14°,8, al Venda il 15 con 12°,2, ecc.; il massimo a Venezia dell'1 (14°,5) è solo di 0°,2 superiore al massimo del 13. In seguito la temperatura diminuì molto rapidamente, tanto da raggiungere il minimo del mese al 20 al Venda −4°,1, al 22 a Padova −5°,1 e a Venezia −1°,0, ecc. L'ampiezza dell'escursione termometrica del mese fu pertanto a Padova 19°,9, al Venda 16°,3, a Venezia 15°,5.

3. In due giorni, al 15 e al 16, tanto la massima, quanto la minima diurna al Venda furono superiori rispettivamente alla massima e alla minima a Padova, ad indicarci la persistenza continuata di un'inversione al suolo; in altri 17 giorni, invece, l'inversione si limitò alla notte e alla prima mattina, perchè in quei giorni solo la temperatura minima al Venda fu superiore a quella di Padova. Le massime differenze tra la minima al Venda e la minima a Padova in questi giorni d'inversione fu di 5°,3 al 14, e di 5°,1 al 15; viene subito dopo il 12 con 3°,2; tutte le altre differenze sono minori di queste.

Nel seguente specchietto sono riportati i valori per le temperature alle varie quote ottenuti quali medie delle temperature delle singole stazioni ed osservatori distribuiti in tanti gruppi a seconda della loro quota: da esso specchio appare anche come l'altezza media decadica dell'isoterma 0° è verso i 1900 m. nella prima decade, verso i 1300 m. nella seconda, e verso i 500 m. nella terza.

| Altezza m. sul livello del mare | 31 | 303 | 576 | 1029 | 1257 | 1517 | 1795 | 2152 |
|---|---|---|---|---|---|---|---|---|
| Numero di stazioni . . . . | (15) | (9) | (8) | (12) | (13) | (11) | (6) | (3) |
| Temper. media prima decade . | 10,1 | 7,3 | 5,5 | 4,2 | 2,3 | 1,5 | −0,5 | −2,6 |
| Temper. media seconda decade . | 5,9 | 3,5 | 2,0 | 0,8 | 0,4 | −1,3 | −3,8 | −5,8 |
| Temper. media terza decade . . | 4,6 | 0,8 | −0,3 | −0,5 | −1,8 | −3,4 | −3,9 | −6,8 |
| Temperatura media mensile . . | 6,9 | 3,9 | 2,4 | 1,5 | 0,3 | −1,1 | −2,7 | −5,1 |

4. Dopo le precipitazioni generali del 1° del mese, si susseguono 4 giorni, che, malgrado qualche leggera registrazione, vanno ascritti tra gli asciutti: dal 6 al 12 si svolge un periodo con precipitazioni, le quali furono generali solo al 7, all'8 e al 10. Tra i valori più notevoli vanno segnati quei dell'8 (g. p.): a Plezzo mm. 81,0, (*totale diurno più alto del mese*), a Caporetto mm. 63,8, a Venzone mm. 55,0, a Schio mm. 31,0. Riprende poi un altro periodo piovoso al 23 che va sino al 28, con precipitazioni generali il 26, e il 27; mancarono quasi del tutto il 25. Al 26 caddero mm. 48,5 a Cortina, mm. 41,0 a S. Michele all'Adige; al 27 (g. p.) mm. 55,0 a Mareson di Zoldo, mm. 54,4 a Bassano, mm. 61,4 a Recoaro ecc. Il 29 e il 30, dato le poche gocce cadute qua e là, si possono considerare come asciutti; il 31 a precipitazioni parziali. L'Isonzo e il Tagliamento accennarono ad un solo leggero incremento tra l'8 e il 9; il Livenza iniziò un incremento al 26 e al 28 all'idrometro di Motta furono raggiunti i cm. 373, a cui seguì un lento decremento. Al Piave, al Brenta e all'Adige nessuna variazione. Al Bacchiglione si verificò un leggero e rapido incremento che raggiunse il massimo al 28; al Frassine due leggeri e rapidi incrementi, dei quali il primo raggiunse il massimo al 2, l'altro al 29.

5. Il *manto nevoso*, che alla fine del mese precedente abbiamo visto stendersi a quote superiori ai 1500 metri, vi ebbe rifornimenti notevoli nel corso di questo, e si estese anche a quote inferiori, specie per effetto delle precipitazioni nella seconda e terza decade. Alla fine di questo dicembre lo spessore del manto nevoso a Monteneve (quota m. 2332) – dove era stato cm. 157 al primo del mese e cm. 210 al 27 – è cm. 185; ai 2000 m. poi è alquanto superiore ai 100 cm., mentre s'aggira verso i 50 cm. ai 1500 m.; ed è tra i 10 e i 20 cm. ai 1000 m. Anche verso i 500 m. in qualche località interna della zona montuosa si hanno cm. 5-10 di neve al suolo.

6. La *media mensile della nebulosità* in questo dicembre è ovunque superiore al valor medio dedotto da molti anni.

| | Pisino | Trieste | Gorizia | Belluno | Treviso | Venezia | Padova | Vicenza | Rovigo | Trento | Bolzano |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Dic. 1929 | 6,5 | 5,9 | 6,5 | 5,1 | 6,7 | 6,5 | 6,9 | 6,3 | 7,3 | 6,4 | 6,7 |
| Val. medio | 5,0 | 6,0 | 5,7 | 5,4 | 5,8 | 6,7 | 5,9 | 5,3 | 7,1 | 4,4 | 3,7 |

7. Dal confronto coi valori normali risulta che in questo dicembre le precipitazioni risultarono scarse, sensibilmente al disotto della normale nell'Istria (rapporto a Pisino 0,67), attorno al normale nel basso Isonzo (Gorizia 0,99) e nel Polesine (Rovigo 0,93), al di sopra del normale nel rimanente della regione: notevoli i valori del rapporto di Venezia (2,51), Bolzano (2,16), ecc.

| | Fiume | Pisino | Pola | Trieste | Gorizia | Plezzo | Belluno | Conegliano | Treviso |
|---|---|---|---|---|---|---|---|---|---|
| Dic. 1929 | 53,7 | 77,8 | 86,5 | 78,3 | 138,0 | 259,3 | 108,8 | 160,2 | 141,1 |
| Valore medio | 155,6 | 116,0 | 94,0 | 90,0 | 139,0 | 268,7 | 73,3 | 70,8 | 71,8 |
| Rapporto | 0,35 | 0,67 | 0,92 | 0,87 | 0,99 | 0,96 | 1,47 | 2,26 | 1,96 |

| | Venezia | Padova | Rovigo | Vicenza | Recoaro | Trento | S. Michele | Bolzano | Silandro |
|---|---|---|---|---|---|---|---|---|---|
| Dic. 1929 | 102,7 | 105,9 | 44,6 | 125,8 | 216,8 | 93,4 | 103,3 | 73,6 | 33,0 |
| Valore medio | 40,8 | 52,4 | 48,0 | 88,6 | 160,0 | 53,0 | 52,0 | 34,0 | 30,0 |
| Rapporto | 2,51 | 2,02 | 0,93 | 1,42 | 1,36 | 1,76 | 1,99 | 2,16 | 1,10 |

8. Dall'esame della *carta delle precipitazioni* appare come è sotto ai 100 mm. tutta la bassa pianura occidentale compresi i colli Berici ed Euganei sino al Bacchiglione e la parte della Laguna Veneta a Sud di Venezia, (Venezia-Lido mm. 103), come pure nella zona montuosa tutta la parte a NW; la isoieta 100, partendo alquanto a Sud del passo Tonale, procede verso levante, taglia il Noce a Clès, l'Adige a Salorno (mm. 97) e poi, mantenendosi sulla sinistra dell'Avisio procede a Sud di Caprile (mm. 63), di Misurina (mm. 82), di S. Stefano di Cadore, e infine raggiunge il confine nelle vicinanze di Timau. La Val Venosta è al di sotto dei 50 mm. (Silandro mm. 33).

In tutta l'Istria le precipitazioni sono attorno ai 90 mm. esclusa la regione Liburnica (M. Lissina mm. 161) e la regione attorno al Monte Nevoso (Cà di Caccia mm. 291).

Lungo la fascia dei massimi prealpini si nota la solita area di massimo sui Lessini (Flaipano mm. 285), altra area al Sud del Grappa (Camposolagna mm. 205), altra sulle Prealpi dell'Arzino (S. Francesco mm. 287, Rio Stavalins mm. 343) e l'altra sulle Prealpi Torre (Musi mm. 522, Uccea mm. 504).

9. La media diurna della *velocità del vento* ha raggiunto o superato i 20 km. ora in 18 giorni al Venda (1, 4, 6, 8, 9, 11, 12, 13, 16, 17, 18, 19, 20, 21, 22, 23, 26, 27), in 10 giorni a Venezia (1, 8, 13, 16, 18, 19, 20, 21, 22, 27), e in 8 giorni a Trieste (16, 18, 19, 20, 21, 22, 23, 27); mentre in questi giorni ventosi, dal 13 in poi, la prevalenza fu sempre pei venti del 1° quadrante (bora), invece nella prima parte del mese, se si esclude l'8, furono venti del 4° quadrante, i quali quindi a Trieste non si fecero sentire con violenza.

Al Venda la media giornaliera massima fu raggiunta al 18 con km. ora 40,4 e massimo diurno 67 km., a Venezia il 20 con 42,2 media diurna; in questo giorno a Trieste la media diurna fu di ben 73,0 km. ora, *valore davvero insolito*; questo giorno fa parte di un periodo quasi ininterotto di bora nell'Alto Adriatico che ebbe inizio al 18 e finì al 23. In questo tempo un forte anticiclone attraversò l'Europa centrale, il nucleo era a mm. 780 sulla Manica al 18, e a 778 su Mosca il 22; intanto un ciclone si tratteneva tra Tunisi e la Grecia nel cui interno la pressione ha variato tra mm. 753 e 756. In questa guisa attraverso le Alpi Giulie si avea un gradiente barometrico molto forte, il quale avea direzione da Nord il 19, ma poi ruotò lentamente verso NE nei giorni successivi.

Dall'esame della *rosa dei venti* a 16 direzioni costruita con i risultati dello spoglio orario dell'anemografo risulta:

A Fiume la maggior frequenza spetta al settore della rosa che va da NW a ENE (71 % a 5 direzioni), con un massimo (20 %) a N.

A Trieste la maggior frequenza spetta alle direzioni orientali comprese nel settore da ENE a SE (70 % a 4 direzioni), con due massimi, l'uno a ENE, l'altro a SE di pari frequenza (22 % a ciascuno).

A Venezia scarse sono le direzioni meridionali comprese nel settore da E a SW (12 % a 7 direzioni); tra le altre si nota un massimo principale a NE (16 %) e due secondari uguali: a NNW e a WSW (11 % per ciascuno).

A Padova sono scarse le direzioni orientali comprese nel settore da ENE e SSW (11 % a 7 direzioni); tra le rimanenti si hanno due massimi: uno principale a N (17 %), un altro secondario ad W (9 %).

Al Venda la rosa ha la solita forma: le direzioni più frequenti si raccolgono attorno a 2 massimi: il principale ad ENE (22 %), il secondario ad WNW (9 %); all'insieme delle 4 direzioni da SSW a SE spetta 8 %; e alle tre: NNE, N, e NNW, 11 %.

A Trento mancano quasi del tutto le direzioni meridionali: difatti nel settore che da E va ad WNW spetta 9 % a 10 direzioni; tra le rimanenti si nota un massimo principale a NNW (31 %), e un massimo secondario a ENE (5 %).

10. La media mensile della *pressione atmosferica*, all'opposto che nei mesi precedenti, è alquanto superiore al valor normale. Difatti l'altezza barometrica di questo mese a Venezia fu mm. 764,0, mentre il suo valor normale invece è mm. 763,0, una differenza pertanto di mm. 1,0.

Il valor massimo raggiunto dall'altezza barometrica è stato di mm. 773,5 alle $11^h$ del 14, e mm. 749,4 alle $9^h$ dell'1; l'ampiezza dell'escursione pertanto è stata mm. 24,1, alquanto inferiore al valor medio della regione, che si aggira attorno ai 27 mm.

Tra le salite del barometro degne di nota ricordiamo: quella dai mm. 749,4 delle $9^h$ dell'1, ai mm. 768,7 delle $14^h$ del 4; mm. 19,3 in 74 ore, pari a mm. 0,26 all'ora; e quella dai mm. 758,3 delle $18^h$ del 10 ai mm. 765,6 delle $8^h$ dell'11; mm. 7,3 in 14 ore, pari a mm. 0,52 all'ora. Tra le discese degne di nota ricordiamo: quella dai mm. 772,0 delle $10^h$ del 15 ai mm. 762,3 delle $15^h$ del 16; mm. 9,7 in 29 ore, pari a mm. 0,33 all'ora e quella dai mm. 759,7 delle $11^h$ del 30 novembre ai mm. 749,4 delle $9^h$ del 1° dicembre; mm. 10,3 in 22 ore, pari a mm. 0,47 all'ora.

N.B. Le altezze barometriche qui riportate sono dedotte dall'Osservatorio di Venezia (Lido) e ridotte a 0° e al livello medio del mare.

11. L'unito specchietto mostra i *tipi isobarici* presentatisi al mattino alle ore 8 e le *condizioni di tempo* nei riguardi delle precipitazioni, da cui essi furono accompagnati nel corso della giornata (da una mezzanotte all'altra).

| Tipi | I | II | III | IV | VI | XI | XIV | XV | XVIa | XVIc | XVII | XVIIIa | XVIII | * | Totale |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Con precip. generali . . | — | 1 | 1 | — | — | — | — | — | 1 | 1 | — | 1 | 1 | — | 6 |
| Con precip. parziali . . | — | — | 2 | — | — | — | — | 2 | — | — | 1 | — | 2 | — | 7 |
| Senza precipitazioni . . | 1 | 2 | — | 1 | 1 | 3 | 2 | — | — | — | — | 1 | 4 | 3 | 18 |
| Totali . . | 1 | 3 | 3 | 1 | 1 | 3 | 2 | 2 | 1 | 1 | 1 | 2 | 7 | 3 | 31 |

Nel periodo asciutto dei primi 5 giorni del mese la situazione isobarica nella nostra regione era dominata dall'anticiclone atlantico che dalle isole Canarie, attraverso lo stretto di Gibilterra, avanzava verso il Mediterraneo (tipo XIV al 4 e al 5), esso si allontanava in seguito verso Sud. Intanto si approfondiva anche il ciclone Islandico (mm. 713 al 4); dipendenza di esso deve dirsi la depressione presentatasi nel Mediterraneo al 6 e che nei giorni successivi si allontana verso SE.

Dal 20 le coste Occidentali Europee passano sotto il dominio del ciclone nordico e al 23, con il costituirsi di un secondario nel Mediterraneo occidentale, ha inizio l'ultimo periodo piovoso del mese; periodo intramezzato da giorni sereni o quasi: per es. il 25 in cui per l'allargarsi dell'anticiclone orientale siamo in un promontorio e momentaneamente in regime anticiclonico; al giorno successivo poi, con l'approfondirsi delle pressioni sul Mediterraneo occidentale, ritornano le precipitazioni. Mancano le precipitazioni al 29 e al 30, in cui sulle Venezie si stende una sella risultante da due cicloni: uno sul mar del Nord, e uno nella parte orientale del Mediterraneo, e da due anticicloni: uno Atlantico, e l'altro Russo. La configurazione è tale che non si potè inquadrarla nella classificazione adottata. Le precipitazioni ritornano al 30, quando, allontanandosi il ciclone Mediterraneo, si costituisce tipo III.

12. Nei giorni 13, 14, 15, 18, 20, la bassa *marea* scese sensibilmente al di sotto della marea prevista mediante l'analisi armonica – la differenza nella bassa marea del 14 ha raggiunto i 43 cm., – cosicchè in quei giorni il livello del mare oscillò entro limiti più ampi di quei previsti; in tutto il rimanente del mese il livello del mare si mantenne sempre più alto di quello che non fosse stato previsto. Le differenze raggiunsero il valor massimo 47 cm. nell'alta marea del mattino dell'1, e in quella del 27.

# PLUVIOMETRIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Le tabelle contengono le osservazioni giornaliere ed i totali mensili delle precipitazioni verificatesi a tutte le stazioni della rete del Magistrato, raggruppate per **bacini principali** (o gruppi di bacini principali)

e per **pianure,** limitate dai principali corsi d'acqua della regione e così denominate:

| | |
|---|---|
| **pianura orientale** | *a*) fra Isonzo e Tagliamento |
| | *b*) fra Tagliamento e Piave |
| **pianura occidentale** | *a*) fra Piave e Brenta |
| | *b*) fra Brenta e Adige |
| **pianura polesana** | fra Adige e Po |

In apposita colonna vengono dati inoltre i nomi dei bacini secondari a cui appartengono le stazioni pluviometriche.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni pluviografiche sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dallo strumento a lettura diretta invece che dal registratore.

Le precipitazioni vengono generalmente misurate al mattino, alle ore 9, e assegnate al giorno in cui venne eseguita l'osservazione; comprendono sia la pioggia che la neve fusa.

I dati giornalieri ricavati dai diagrammi pluviografici comprendono le quantità di pioggia registrate dalle ore 9 del giorno precedente alle ore 9 del giorno che si considera.

Per ogni stazione è indicato il numero dei giorni con precipitazioni uguali o superiori ad 1 millimetro.

*Manto nevoso.* — Nella tabella vengono raccolte le altezze giornaliere del manto nevoso in cm. per alcune stazioni; per ogni stazione è segnata in grassetto la massima altezza raggiunta dalla neve durante il mese.

Le altezze del manto nevoso vengono misurate con un'asta metrica posta nelle immediate vicinanze del pluvionivometro; esse danno quindi l'altezza del manto nevoso soltanto per il punto di misura.

### SEGNI CONVENZIONALI

P, pluviometro a superficie ricevente di $^1/_{10}$ di m.$^2$;
Pn, pluvionivometro id. id. id. id.
Pa, pluviometro a superficie ricevente di $^1/_{20}$ di m.$^2$;
Pv, pluvionivometro id. id. id. id.
Pr, pluviografo;

—, nessuna precipitazione;
*, neve;
•, pioggia;
□, precipitazioni avvenute sotto forma di neve non misurata;

», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dallo strumento a lettura diretta invece che dal registratore.

**Avvertenze.** — I valori massimi giornalieri delle precipitazioni sono indicati col carattere grassetto.

NB. — Dato il carattere prevalentemente carsico della regione compresa tra la Fiumara e l'Isonzo, la delimitazione dei bacini imbriferi è generalmente incerta e in qualche caso ha solo un carattere convenzionale.

# REGIME DEI CORSI D'ACQUA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

**Altezze idrometriche giornaliere.** — Vengono raccolte in questa tabella le osservazioni eseguite agli idrometri principali, in funzione lungo i corsi d'acqua più importanti della regione.

Per ogni stazione viene indicato il tipo di strumento al quale, durante il mese, vennero eseguite le osservazioni; le stazioni provviste di idrometrografo sono stampate in carattere grassetto e conservano tale distinzione anche nei mesi in cui, per una causa qualsiasi, i dati devono essere desunti dalla lettura all'idrometro invece che dal registratore.

Nella II parte (annua) del Bollettino vengono riportate le caratteristiche di tutti gli idrometri della rete del Magistrato.

I valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese.

Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico, quelle stampate in carattere *minuscolo* e distinte dal segno — posto al di sopra di ognuna di esse, sono *sotto* lo zero idrometrico.

**Deflussi giornalieri e mensili.** — Per le principali stazioni per misure di portata vengono in questa tabella raccolti i valori seguenti: altezze idrometriche giornaliere, portate in mc. al secondo giornaliere e mensili, deflussi giornalieri e mensili.

Per le stazioni con idrometro a lettura diretta si è assunto come valore della portata giornaliera quello che corrisponde all'altezza osservata il giorno stesso all'idrometro di stazione. Per le stazioni fornite di registratore, si è assunta come portata giornaliera, quella corrispondente alla media delle altezze registrate ogni sei ore e, nel caso di notevoli variazioni del livello, quella corrispondente alla media delle altezze orarie.

I valori delle portate desunti dalle relative curve, vengono corretti mediante la curva di Stout, determinata in base alle variazioni verificatesi nelle singole sezioni.

I valori più elevati del mese sono stampati in grassetto, quelli più bassi in corsivo e sottolineati.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato e per secondo, calcolato per le portate massima, minima e media del mese.

**Misure di portata.** — La tabella riporta l'elenco ed i risultati delle misure di portata eseguite nel mese a cura dell'Ufficio. Per ognuna di esse viene indicato il bacino imbrifero in kmq. ed il contributo per kmq. in litri al secondo.

**Materiale in sospensione nell'acqua dei fiumi.** — Viene determinato e pubblicato: per l'**Isonzo** a *Salcano*, per il **Tagliamento** a *Vensone* e *Latisana*, per il **Piave** a *Segusino*, per il **Brenta** a *Bassano* e *Codevigo*, per il **Frassine** a *Borgo Frassine*, per l'**Adige** a *Pescantina* e *Boara Pisani.*

### SEGNI CONVENZIONALI

I, idrometro;
Ir, idrometro registratore;
», non giunte le osservazioni; dato mancante;
?, dato incerto;
(·), dato desunto dalle letture all'idrometro invece che dal registratore;
(··), dato interpolato;
°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione, oppure dalle manovre degli impianti per derivazione d'acqua.

(*) Nella portata è anche considerata quella del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.³ 3 ed in primavera - estate i m.³ 16. Calcolando per l'inverno una portata media di 2 m.³ e per la primavera - estate di 15 m.³ veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata. Per la stazione di Legnago non sono calcolati i contributi unitari in conseguenza delle rilevanti perdite per infiltrazione che si verificano nell'alveo nel tratto Pescantina-Legnago.

(1) Vedi nota 1 a pagina 39.

# GEOIDROLOGIA

Le osservazioni freatimetriche vengono effettuate dieci volte al mese nei giorni 2-5-8-11-14-17-20-23-26-29, al mattino, prima degli ordinari attingimenti d'acqua.

Le stazioni sono elencate in relazione alla progressiva distanza dall'asse dei corsi d'acqua e procedendo da monte a valle. I nomi stampati in grassetto indicano che la stazione è fornita di apparato registratore dei livelli freatici.

Le quote del pelo d'acqua nei pozzi sono tutte riferite al livello medio del mare. Per la pianura fra Tagliamento e Torre, per quelle del Brenta e dell'Adige le quote dei pozzi sono state desunte dalle tavolette al 25.000 dell'Istituto Geografico Militare e devono pertanto ritenersi approssimate; per gli altri pozzi le quote sono state determinate mediante livellazione geometrica.

**SEGNI CONVENZIONALI**

°, idrometro a lettura diretta o registratore posto in località ov'è sentito l'influsso della marea o delle manovre degli impianti per derivazione d'acqua;
», non giunte le osservazioni, dato mancante;
?, dato incerto.

## Osservazioni freatimetriche e variazioni freatiche in relazione alle condizioni idrometriche

# MAREOGRAFIA

## NORME PER L'UTILIZZAZIONE DEI DATI RACCOLTI

Tutte le altezze di marea pubblicate nel bollettino sono espresse in centimetri e riferite ad una superficie ideale di base situata a m. 1.50 sotto il livello medio del mare, origine della rete altimetrica dello Stato, (si ottengono così nelle altezze di marea valori sempre positivi).

Le letture dirette delle altezze di marea, per il controllo del funzionamento degli apparati registratori, sono effettuate a partire da uno speciale bullone (caposaldo) quotato mediante collegamento di precisione coi caposaldi della rete altimetrica suddetta.

Le altezze di marea di Trieste invece sono riferite, dal Gennaio 1929 in poi, ad un piano ideale posto a 150 cm. sotto il livello medio determinato dal Prof. Hopfner sulla base dei dati orari del 1911. Tale livello medio si trova a cm. 252.9 sotto il caposaldo verticale dell'I. G. M., fissato alla parete interna NE della cabina mareografica.

Per riferire al suddetto piano ideale tutti i dati pubblicati nei bollettini dell'Ufficio Idrografico dal luglio 1926 a tutto dicembre 1928 si devono aumentare i dati stessi di 5 cm.

In tal modo possiamo dare le altezze di marea riferite al livello medio del mare, che abbiamo assunto come fondamentale in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

I tempi sono calcolati sul tempo medio Etneo (T. M. E. C.).

Le stazioni mareografiche, delle quali si pubblicano i dati, sono state scelte:

TABELLE I e II. — Per lo studio del fenomeno di marea nell'Adriatico: Marano Lagunare, Porto Falconera, Diga Sud del Porto di Lido, San Felice di Chioggia (entro il Porto di Chioggia); Trieste, Ancona, Viesti.

TABELLA III. — Per lo studio del fenomeno di marea entro la Laguna di Venezia: oltre a Diga Sud del Porto di Lido, Punta della Salute (Venezia, bacino di S. Marco), Porto industriale di Marghera.

TABELLA IV. — Per lo studio del fenomeno di marea agli estremi limiti della laguna ed in relazione agli studi di bonifica: Conche (vecchie foci della Brenta in laguna di Chioggia), Pagliaga (confluenza del fiume Dese con il canale Osellino presso la foce in laguna); Brondolo (fiume Brenta, alla confluenza del canale di Valle, presso la foce).

TABELLA V. — Questa tabella dà i valori massimi e minimi raggiunti dal livello del mare nel mese, con le relative escursioni.

TABELLA VI. — La tabella dà la massima ampiezza di marea osservata nel mese, sia fra alta e bassa come fra bassa ed alta marea consecutive.

**Materiale in sospensione nelle acque lagunari.** — In questa tabella vengono raccolti i dati relativi al materiale in sospensione nelle acque lagunari all'interno dei Canali Porti di Lido e di Malamocco e precisamente in corrispondenza alle località S. Nicolò di Lido e Faro Rocchetta.

A S. Nicolò di Lido (Canale di S. Marco) i saggi vengono raccolti, sia in flusso che in riflusso, durante i periodi di tempo nei quali si ritiene che la velocità di corrente raggiunga i valori più elevati.

A Faro Rocchetta (Canale Rocchetta) i saggi vengono raccolti in prossimità dell'alta e della bassa marea.

La torbidità è espressa in *grammi per metro cubo* (gr./ m.$^3$).

I dati suddetti, rilevati in un determinato istante ed in un singolo punto della laguna, possono dare soltanto una nozione molto approssimata sul trasporto del materiale di sospensione nelle acque lagunari; essi potranno inoltre fornire degli elementi di guida per le ricerche future.

**Salsedine delle acque lagunari.** — Nella tabella vengono raccolti i dati della salsedine delle acque lagunari, rilevati nella mezzaria del Canale di S. Marco tra S. Nicolò di Lido e l'isola di S. Andrea, in corrispondenza delle massime alte e delle minime basse maree di ciascun periodo sigiziale, limitato dai tre giorni che comprendono ogni lunazione. I dati suddetti vengono raccolti allo scopo di definire le variazioni a lungo periodo della salsedine in laguna.

La salsedine è espressa in Cl. ‰ (quantità di cloro in grammi per litro) *ed in salinità* S (quantità di sali in grammi per chilo di acqua).

**SEGNI CONVENZIONALI**

», dato mancante; — (**), dato interpolato o calcolato in base ad osservazioni interpolate; — †, dato incerto

N.B. — I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.
